Many of the mild forms of constipation so prevalent to-day are attributed to the consumption of foods deficient in Vitamin B' In comparing the effects of various kinds of bread it is seen that HOVIS germ bread is superior to either white bread or wholemeal in supplying this deficiency Whilst white bread contains practically no Vitamin 'B, HOVIS, with its added proportion of 25% wheat-germ, supplies an abundance of this essential food-element Unlike wholemeal bread, HOVIS contains only a minute percentage of bran and indigestible cellulose In other words its incorporation in the normal diet ensures not only a higher standard of nutrition but easier assimilation and regular evacuation of the intestinal contents

VITAMIN 'B' CONTENT ACTS AS AID TO REGULARITY

INFANTILE ECZEMA.

A quick cure—'would usually take months' writes doctor

The doctor's letter

I happened to have in my consulting room a baby with eczema of the scalp which would normally have taken me months to cure

I tried it with Sphagnol Ointment with most satisfactory results and am so pleased with the preparation that I should be grateful if you would forward me a pound package of it

Yours truly

——— M B

Reports of speedy cures with Sphagnol Ointment are not uncommon but the great virtue of Sphagnol Ointment is this— that from the first touch it is soothing cooling Used against eczema Sphagnol brings sure relief from itching and at the same time its healing peat principle helps the growth of clear healthy skin

Perhaps you have had no personal experience of Sphagnol Then the makers will gladly send you free samples

PISTANY SPA MUD

for HOME and HOSPITAL TREATMENT of persistent ***RHEUMATIC*** *disorders*

Different from ordinary heat therapy

Why? Simultaneously with the physiological responses of the body to heat reactions are caused specifically by this hot sulphurous radio active "living" mud A detailed account of the analytical biological and clinical evidence appears in the September British Journal of Physical Medicine

How? It is easy and clean to apply The hot mud is wrapped in cellophane in which a window is cut to expose the mud surface to be laid on the skin This method entirely meets the condition prevailing in clinics or homes, and costs very little to apply For demonstration phone LANgham 4211

WATSON Ultra-Violet Apparatus Technical Advances give Improved Efficiency

The Alpine Sun ultra-violet lamp, in its most recent form, embodies technical advances which have resulted in a material improvement in efficiency The general form of the lamp, evolved as a result of many years of clinical experience, however, is substantially unchanged

With the Alpine Sun, general or local irradiation may be applied with equal convenience, no other existing apparatus so ideally meeting the needs of private practice For hospitals, too, the Alpine Sun lamp is a popular choice, but other Watson apparatus is also available to suit special requirements such as collective treatment and combined ultra-violet and infra-red irradiation

Please write or telephone for the latest Watson Sunlight catalogue or for particulars of any other electro-medical or X-ray equipment in which you are interested

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in January, 1938

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post Graduate study

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, may be obtained from the Medical Director General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than November 22nd, 1937

HIS MAJESTY'S COLONIAL SERVICE

COLONIAL MEDICAL SERVICE.

The Secretary of State for the Colonies proposes to select within the next few months not less than 12 Medical Officers to fill vacancies the majority of which will occur in Tropical Africa or in Malaya

QUALIFICATIONS —Candidates must be British subjects of European parentage under 35 years of age and must possess a medical qualification registrable in the United Kingdom Preference will be given to candidates who have held Hospital or Public Health appointments or who have special knowledge of anaesthetics radiology surgery medicine ophthalmology, gynaecology and midwifery diseases of the ear nose and throat venereal diseases etc

SALARY —Initial salaries vary from £600 to £700 and rise by increments to a maximum of between £1 000 and £1 200

PRIVATE PRACTICE —Private practice is not allowed as of right, but in the case of some appointments it is permitted on certain conditions

QUARTERS —In Tropical Africa free quarters or an allowance in lieu are provided In Malaya quarters are provided at an annual rental not exceeding 6% of the officer s salary

PASSAGES —Free first-class passages are provided on first appointment and when proceeding on and returning from leave Assistance is also given towards family passages

TERMS OF APPOINTMENT —The appointments are pensionable, subject to a probationary period which varies from two to three years

COURSES OF INSTRUCTION IN TROPICAL MEDICINE AND HYGIENE —Selected candidates will normally be required to attend a course of instruction leading to the Diploma in Tropical Medicine and Hygiene before proceeding overseas

DUTIES — Although Medical Officers are appointed in the first instance for general service there are opportunities for work in special branches of medicine and surgery in public health and in medical research

Further particulars and forms of application may be obtained from the Director of Recruitment (Colonial Service), 2, Richmond Terrace, Whitehall, London, S W 1

LATENT SYPHILIS AND THE AUTONOMIC NERVOUS SYSTEM

By GRIFFITH EVANS, M A D M (Oxon) F R C S, D O M S

This volume is unquestionably a very important contribution to syphilology The reviewer is convinced that if this second edition is carefully studied by all who are engaged in medical work a great deal of unsuspected syphilis will be uncovered and with that much human suffering will be alleviated —*Medical Officer*

Oral Vaccine for the prevention of Colds and Influenza

Since Genora brand Oral Vaccine was introduced to the Medical Profession last Winter, extensive clinical and laboratory tests have shown that it establishes a high degree of immunity against colds and influenza, the oral vaccine has also proved successful in the treatment of chronic bronchitis and similar respiratory infections

This vaccine contains hæmolytic streptococci, in addition to other organisms incriminated in the causation of coryza and influenzal infections It has been found that the ingestion of the oral vaccine against colds and influenza also develops immunity to diseases caused by hæmolytic streptococci

Particulars concerning Genora brand Oral Vaccine will be found in the new brochure on Vaccine Therapy which has recently been published by Genatosan Ltd This booklet also gives information regarding a wide range of vaccines administered by hypodermic injection and the standard types of Local Immunity Products A copy of the brochure will gladly be supplied to any physician on request

Standard in Gonorrhoea

ARGYROL

Brand Silver Vitellin

"Argyrol" is the original mild silver salt, unique in its field and unlike any other in therapeutic effect

For more than thirty years, Argyrol has been the standard in the treatment of Gonorrhoea No other silver sal has served the medical profession so long and successfully

Argyrol not only attacks the gonococcus but soothes the inflamed mucosa and stimulates tissue reaction

Its peculiarly sedative inflammation allaying qualities may be easily accounted for by pertinent chemical facts

The very great differences between Argyrol and other silver salts in silver ion and in hydrogen ion concentration (or alkalinity) no doubt have much to do with the irritation noted by doctors when allegedly equivalent mild silver proteins are used The pH and pAg of Argyrol are especially regulated for treatment of delicate mucous membranes. Insure the results you expect—specify "ARGYROL."

MANDECAL

(Compound Calcium Mandelate B D H)

The introduction of MANDECAL for use in the treatment of urinary infections is the outcome of an investigation (Lancet, May 8th, 1937, p 1104) undertaken with a view to finding a means of overcoming certain disadvantages, such as occasional nausea and dyspeptic discomfort, which are associated with mandelic acid treatment In this investigation 'the same good results' were obtained with calcium mandelate as with other preparations of mandelic acid, but without any of the drawbacks associated with the latter treatment.

MANDECAL is a light, pleasantly-flavoured powder containing 75 per cent. of pure calcium mandelate, it possesses an outstanding advantage accruing from its ready miscibility with water It is necessary merely to measure the required dose and to stir it into about two fluid ounces of water in a glass, immediately an even suspension is formed ready for administration

MANDECAL is available in bottles containing approximately 130 grammes, sufficient for treatment lasting seven days

GONADOTROPIC HORMONE THERAPY

Gonadotropic hormone therapy has hitherto been confined to the use of urinary hormones, such as GONAN, *with predominantly luteinising properties A follicle-stimulating hormone from the serum of pregnant mares is now available under the name* SEROGAN

SEROGAN

The action of SEROGAN is predominantly that of ovarian follicle stimulation It is therefore specifically indicated in the treatment of conditions resulting from deficient follicular secretion, such as amenorrhœa, hypomenorrhœa, or dysmenorrhœa associated with uterine hypoplasia

GONAN

GONAN is the gonadotropic hormone from the urine of pregnancy, and its effect upon the ovary is primarily luteinising It is used to stimulate the luteal secretion in habitual abortion, menorrhagia, metrorrhagia, or spasmodic dysmenorrhœa associated with normal uterine development

FOR EFFECTIVE CONTROL OF PAIN

AMONG the many and diverse analgesics which have been evolved by modern chemical research acetyl salicylic acid retains its reputation as one of the safest and most effective Its tendency to liberate salicylic acid—the irritant properties of which are well known to physicians—has however caused many to hesitate to employ it as widely as it deserves Exhaustive trial in hospital and private practice proves that Alasil definitely solves the problem of administering acetyl salicylic acid in an effective form being free from the risk of irritating the stomach or bowels or of causing general reactions.

A supply for clinical trial with full descriptive literature sent free on request

In "Alasil" the desirable therapeutic effects of acetyl salicylic acid are well exhibited by its calcium acetyl salicylate moiety, while the presence of Alocol" (Colloidal Hydroxide of Aluminium), a powerful gastric sedative and antacid, obviates any tendency to gastric irritation. The superior absorbability of 'Alasil" over ordinary salicylate compounds and its freedom from the risk of liberating free salicylic acid in the stomach have been well proved by careful experimentation Alasil can be prescribed with perfect safety to patients of all ages and in larger doses than ordinary salicylate compounds

Towards national health —

"National Health cannot be attained or maintained without food that is adequate both in quantity and in quality"

(Annual Report of the Ministry of Health 1936-1937 p 49)

The imperative need for the nation to choose its foods wisely is a theme which is attracting considerable attention, and in this connection emphasis is placed on the importance of vitamin-containing foodstuffs

Members of the medical profession appreciate the dietetic value of Marmite—the yeast extract rich in vitamin B_1 and B_2 complex

Marmite is prescribed extensively with beneficial results in preventive and curative medicine, it is ordered particularly when vitamin B therapy is indicated and in certain forms of anaemia

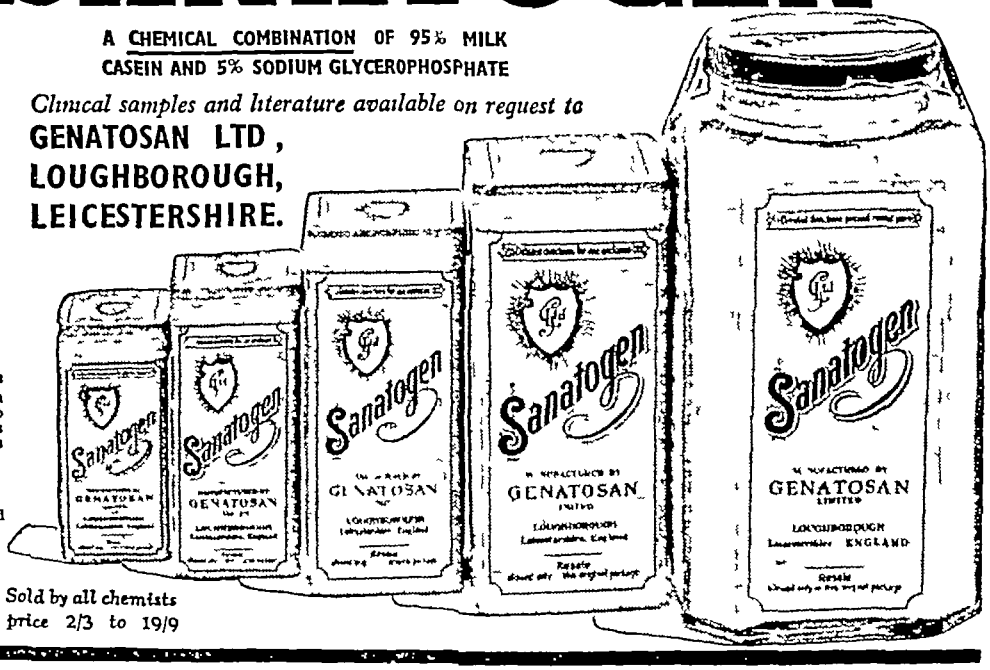
Convalescence

In convalescence a tonic is required that will co-operate with, and augment, the natural recuperative powers of the body, rather than one which will have only an immediate stimulating effect. In the latter case there is always the danger of disappointment, due to an artificial improvement that the natural powers are unable to stabilise.

Medical evidence extending over many years has established the value of Sanatogen in promoting convalescence In "The Elements of Pharmacy, Materia Medica and Therapeutics", Sir William Whitla writes —

> *The interesting and valuable researches conducted by Tunnicliffe and Beddoes upon metabolism, in which Sanatogen was experimented with, establish the fact that its organic phosphorus is almost entirely assimilated when the food is administered in the amount necessary for the needs of the body When given in addition to other food, the amount of nitrogen and phosphorus retained in the organism is increased the tissue metabolism is more complete, the constituents of the ordinary food being more thoroughly utilised, appetite is increased and the body weight augmented"*



Similarly gratifying observations are constantly being notified, and, as Sanatogen is entirely free from fats, sugars and carbohydrates, it can safely be prescribed in all types of cases. It is rapidly and easily digested and assimilated, even in cases exhibiting severe gastric inflammation, and for this reason it is a valuable addition to enemata It can be added to any non-acid beverage or food, and, consequently, monotony in its administration can always be avoided.

SANATOGEN

A CHEMICAL COMBINATION OF 95% MILK CASEIN AND 5% SODIUM GLYCEROPHOSPHATE

Clinical samples and literature available on request to

GENATOSAN LTD, LOUGHBOROUGH, LEICESTERSHIRE.

DOSAGE: For children and adults two teaspoonfuls three times daily or according to circumstances For infants, ½ teaspoonful added to each bottle feed.

PENSIONS & INSURANCE

FOR

MEDICAL PRACTITIONERS

The Insurance Acts Committee of the British Medical Association acting as the executive body of the Conference of Representatives of Local Medical and Panel Committees after protracted investigation, recommended to all Insurance Practitioners a

Pension and Insurance Scheme providing

(a) Pension at age 65

(b) Disablement Income

(c) Family Protection

The extraordinarily low rates quoted are available only until

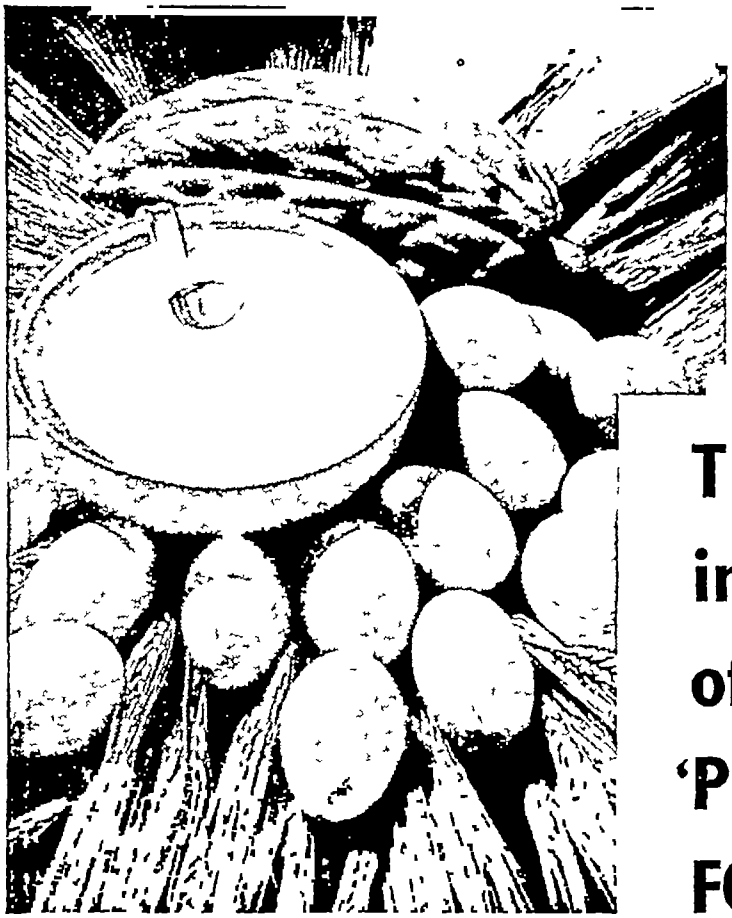
September, 1942

but policies effected prior to that date will not be affected by any alteration made thereafter

The Council of the British Medical Association resolved that this scheme should be made available also to members not engaged in National Health Insurance practice

These policies are issued through the Medical Insurance Agency of B M A House, Tavistock Square, acting as agents of the Insurance Offices for the collection and receipt of quarterly premiums

Other insurances, Motor Household Educational etc are also available at specially favourable rates



In this as in all else

'Elastoplast' in the treatment of Varicose Veins

Whether the veins are being treated by injections or not, the application of 'Elastoplast' is indicated owing to the firm and even pressure which it affords. After each attendance for injections the firm application of an 'Elastoplast' Bandage, from the toes upwards, will help to prevent the painful phlebitis so often produced.

In certain cases, where on account of systemic disease, or the patient's timidity, a course of injections cannot be given, then the veins can be kept obliterated by the pressure of an 'Elastoplast' Bandage. A useful technique, with or without injections, is as follows —

Short lengths of 'Elastoplast' are rolled with the adhesive side out, in cigarette form These are placed along the course of the vein. The 'Elastoplast' Bandage is then applied firmly and evenly from behind the toes upwards If the patient prefers a non adhesive bandage, either 'SEMIPLAST' or 'ELASTOCREPE' is used

A copy of "Elastoplast Technique' will be sent on request.

'VENTRON'

Capsules

'VENTRON' is a combination suitable for the treatment of many forms of primary and secondary anæmia and for use as a general hæmatinic and tonic in any form of debility, especially in patients recovering from operations or severe infections It contains desiccated gastric tissue (Ventriculin) in concentrated form, together with the vitamin B complex and iron and sodium citrate—a neutral soluble iron compound that is practically non-irritating to the gastro-intestinal tract and has a decided advantage over most other iron preparations

'Ventron' Capsules contain	
Ventriculin (concentrated) (*equiv to 15 grs of Ventriculin*)	5 *grs*
Naferon (Iron and Sodium Citrate Neutral)	2 *grs*
Vitamin B_1	20 *International units*
Vitamin B_2	5 *Sherman units*

'Ventron' is issued in bottles of 50 hermetically sealed capsules, which eliminate the taste and bulk associated with other methods of exhibiting desiccated gastric tissue

For the maintenance of adequate vitamin reserves

It is essential that the vitamin reserve which has accumulated during the summer months should be maintained throughout the winter, to enable the body to meet the extra strain and stress imposed upon it and to withstand the onslaughts of invading organisms

The all-round vitamin shortage which prevails in the average winter dietary militates against this reserve being maintained By the regular daily administration of a spoonful or two of Radio-Malt, a palatable confection containing standardised amounts of Vitamins A, B_1, B , and D, a supply of these vitamins adequate for all needs is provided and a uniform vitamin balance maintained in the body throughout the year

RADIO-MALT

(Standardised Vitamins A B_1 B and D)

Sample on request

SERENOL

biological non-toxic

SEDATIVE

Formula

Campho Sulphonate of sparteine	6 0 grams
Campho Sulphonate of ephedrine	2 5 „
Extract of boldo - - -	10 0 „
Extract of crataegus - - -	20 0 „
Extract of salvia - -	10 0 „
Tincture of marrubium - -	10 0 „
Glycerine extract of thyroid (1 equals 1 of fresh gland) -	0 10 „
Valerian - - - -	50 0 „
Hexamethylene tetramine - -	10 0 „
Excipient q.s - - -	ad 1,000 c.c.

Serenol is a sedative with action on the centres of the nervous vegetative system, sympathetic and parasympathetic, and on the cortical centres Recent knowledge has shown the interaction of nervous vegeta tive system and endocrine system, and on this knowledge SERENOL is based It is thus a biological, not a symptomatic, sedative, and, unlike many other sedatives, has not a direct depressant action on the cortical cerebral centres

Serenol possesses this action on the basis of its formula.

Serenol is indicated in conditions of anxiety and general irritability, insomnia, hyperthyroidism, hyperadrenalism (as in neurocirculatory asthenia, effort syndrome), the so-called nervous palpitations of the heart, etc.

Serenol is given in the following dosage. For mild cases one to two dessert spoonsful on retiring For more severe cases one dessertspoonful at 10 a m , one dessert-spoonful at 4 p m and two dessertspoonsful on retiring

Serenol, being a biological sedative containing no barbiturate, is not habit forming

PRICE - 4/6 per 4 oz. bottle

TRIVALIN

THE FINEST ANODYNE

(Supplied solely to the Medical Profession)

In ampoules for injection, capsules and Tablets

Extracts from Clinical Reports

Cancer. I have used Trivalin with most satisfactory results in Carcinoma of the Mamma No preparation I have tried including Morphia (which produced vomiting) gave so much relief

---

I consider the addition of Hyoscine valuable in Morphia suppression and have found the combination valuable in hysterical frenzies and other forms of mental excitement

---

I shall continue to use it when Morphia is indicated and particularly when Morphia-action is indicated but Morphia itself contra-indicated

---

For adequate treatment of

PERNICIOUS ANAEMIA

Lederle's "1 cc Concentrated Solution Liver Extract" offers these advantages

A high degree of therapeutic effectiveness—

A small volume for each injection—

A minimum of discomfort from each injection—

An individual dose container (additional safety)—

Economical treatment of the disease—a given amount of active material injected being equivalent clinically to from 30 to 50 times that amount taken orally—

It provides for the use of large amounts of active material which are frequently required for the treatment of the nervous system changes—

Relatively long intervals, 7 to 20 or more days, between injections—

Supplied only in boxes of 3—1 cc vials

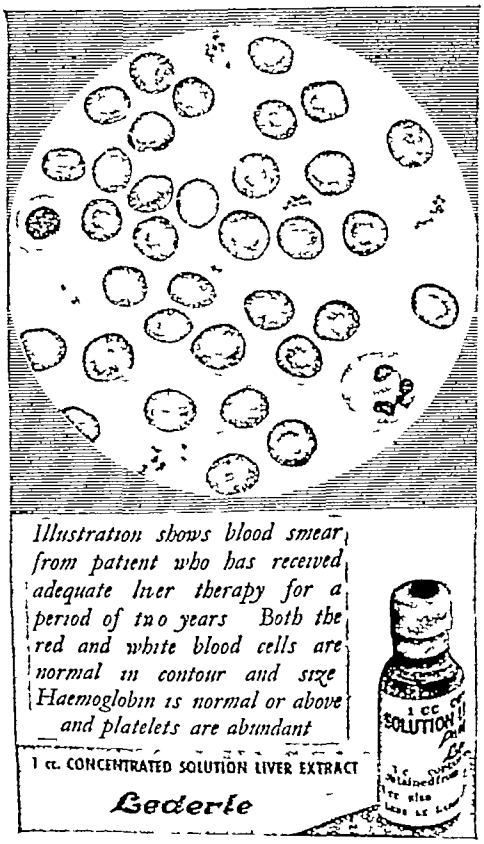

Illustration shows blood smear from patient who has received adequate liver therapy for a period of two years. Both the red and white blood cells are normal in contour and size. Haemoglobin is normal or above and platelets are abundant

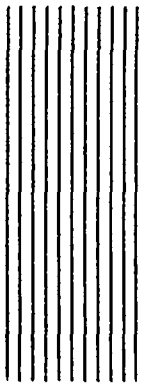
Where Thirst and Irritation of the Stomach and Kidneys *must be avoided...*



Brand's Essence cannot cause thirst or in any way irritate the stomach or kidneys . . it contains no added salts or seasoning and is a basically pure essence. Thus, the advantages of Brand's as a stimulant, protein-sparer, and adsorbent of excess free acid, can be fully applied in many circumstances that prohibit the use of some preparations.

BRAND'S CHICKEN OR BEEF ESSENCE

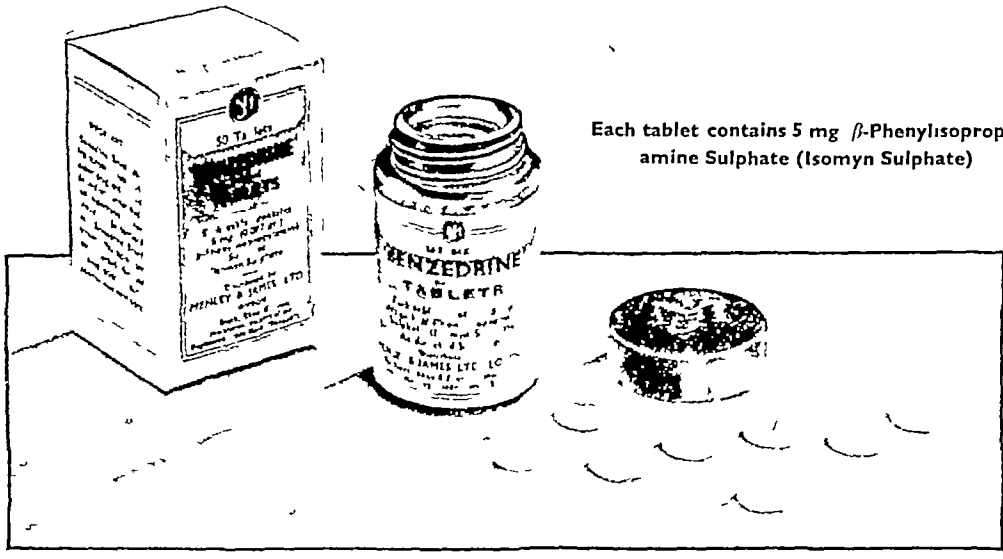
is never contra-indicated

BRAND & CO LTD., SOUTH LAMBETH ROAD, LONDON, S W 8

"To my patients probably the most appreciated drug which we have come to use frequently in the last two years is ergotamine tartrate which in most cases will bring prompt relief to sufferers from migraine"

Volume 8 Clin Med & Surg Jan 1937

MIGRAINE



Clinical experience of recent years has provided ample proof of the fact that no other drug has given results so uniformly successful as FEMERGIN (ergotamine tartrate) in the treatment of migraine Even patients who have long been subject to migraine attacks, often of great severity, have in the majority of cases obtained almost miraculous relief following the administration of FEMERGIN

FEMERGIN is most effective when given early in an attack, but even fully developed seizures are often relieved in one or two hours The dosage should be varied to find the smallest amount that will be effective, but generally 0 25 to 0 5 cc by hypodermic injection will suffice to abort or cut short an attack In mild cases satisfactory relief may be obtained from oral administration

biliary disease It must be remembered that in patients who have already developed gall-stones recurrent attacks of cholecystitis are common and often severe

Acute Infective Cholecystitis—This is a surgical emergency and needs no discussion

Catarrhal Cholecystitis—This is the variety I wish to bring into the forefront of discussion to day It is due to infection with organisms of obviously low-grade virulence, and often smoulders on without giving rise to serious or acute symptoms for a long period of time It is difficult to diagnose, but if untreated is likely to be followed by gall-stones and many other complications

Symptoms and Diagnosis

Moynihan, in the days of the rapid development of gall-bladder surgery, described the "inaugural symptoms of gall-stones" These, we know now, were the symptoms of the preceding cholecystitis, but at a later stage than we must now identify them At that time it is fair to say that the early stages, except of the acute and fulminating variety constituting a surgical emergency, were seldom if ever sought for or recognized It is the diagnostic problem involved in the common catarrhal cholecystitis that I wish to emphasize, and a correct diagnosis will often be missed and treatment too long delayed if the doctor fails to investigate further all cases of dyspepsia which do not respond to simple treatment He may, and generally does, consider the possibility of gastric or duodenal ulcer, and is disappointed when the *x*-ray examination by barium meal which he advises yields a negative result He may think of chronic appendicitis, but up to the present he too seldom thinks of the great frequency of gall-bladder disease as a cause of dyspepsia The association of flatulence with the dyspepsia is suggestive, but by no means conclusive

It is best at the very outset, when considering how the diagnosis of gall-bladder infection may be proved, to admit the difficulties involved The diagnosis by simple clinical methods is easiest when gall-stones are present Biliary colic occurs in roughly 40 per cent of such cases, while recurrent acute attacks of cholecystitis lead to obvious signs in the right upper quadrant Further, it is in these cases that cholecystography is of such great diagnostic value Even when gall stones are absent the local signs of tenderness or pain or both below the right costal margin may, along with the presence of flatulent dyspepsia, strongly suggest the diagnosis The real difficulty arises in the cases—and they are many—in which a catarrhal cholecystitis is associated with dyspepsia only, without local pain or tenderness over the gall-bladder at all These are the early cases in which medical treatment may be of avail How are such cases to be completely and positively diagnosed so that proper treatment may be carried out? Ordinary simple clinical methods fail us here—what help can we obtain by other methods?

I must first refer to cholecystography, but omit any lengthy discussion, since Dr Hardman is to deal with this aspect of the subject I will only say that in my experience which is now considerable, the use of the dye followed by *x* rays generally does not yield information of positive diagnostic importance in the early cases of catarrhal cholecystitis in which physicians are so interested I am too often confronted with an *x*-ray diagnosis of pathological gall-bladder or poor filling or faintness of shadow, which are taken to indicate disease when I know full well the differences in technique and the differences in absorption of the dye, even on different days in the same person On the whole I am still very chary of accepting a diagnosis of early cholecystitis on *x*-ray evidence, whatever improvements in technique may later make possible

We now come to the method of duodenal intubation, and here I feel on quite different and much more secure ground I would go so far as to say that in early cholecystitis it is at present the only diagnostic method on which we can positively rely It is far too little used in Britain, but is a routine method in America and elsewhere I have indicated in a recent paper some of the reasons why it has not yet obtained its proper place in diagnosis with us, and I feel this defect must be remedied Perhaps, as in many tests of this kind, too much was at first claimed for the method, but of its diagnostic value in experienced hands I have no doubts at all

Differential Diagnosis

This is at times easy, but is often difficult unless the technique of duodenal drainage is employed This section might easily detain me too long, for the differential diagnosis from chronic gastritis, pylorospasm, peptic ulcer, carcinoma, and peripyloric adhesions would require consideration Moreover, peptic ulcer and chronic cholecystitis may coexist I have seen a number of examples of this combination The clinical differentiation between cholecystitis and chronic appendicitis is not easy, and here again the duodenal tube may be the only real help Diseases of the liver itself, especially early cirrhosis, are frequently confused with gall-bladder infections I have made this mistake too often and have seen the cirrhotic liver exposed by the surgeon when my confident diagnosis was chronic cholecystitis I deliberately omit more than a reference to important diseases situated outside of the abdomen—such as coronary thrombosis—which have frequently been mistaken for cholecystitis, since Dr Miller will be speaking on this point

Treatment

This will be discussed in detail by subsequent speakers, and I need only deal with some general principles I have already alluded to the difficult problem of deciding on the site of the microbic infection and the important bearings the solution of this problem must have on treatment by drugs excreted in the bile Next I must refer especially to the form of treatment now commonly known as "non surgical drainage of the biliary tract" This treatment began with the use of the duodenal tube, repeated emptying or rather partial emptying of the gall-bladder being induced by the direct injection through the tube into the duodenum of either a concentrated solution of magnesium sulphate or olive oil Later it was found in practice that the passage of the duodenal tube was unnecessary, the same drainage of the biliary tract being obtained by giving the patient a small dose of concentrated magnesium sulphate solution on an empty stomach I am convinced of the great value of this form of treatment when persisted in daily for months

As regards diet in the treatment of early cholecystitis and the prevention of gall-stones, I am far less strict (except when obesity forms part of the problem) than are many physicians I do not see the need for restriction in cholesterol-containing foods, since the body can obtain a supply from so many foods The only essential restriction is cooked fat, and especially "fried foods," which aggravate the common flatulent dyspepsia I do not exclude butter or milk in moderate amount, and olive oil (a food) has great value in preventing flatulent dyspepsia and in emptying the biliary tract, although it does *not* dissolve gall-stones

A purified fraction of liver extract possessing remarkable hæmopoietic properties

NEO-HEPATEX

(PARENTERAL)

For intramuscular or intravenous use

Neo-Hepatex (parenteral) is the result of an original process designed to conserve the maximum amount of the active hæmopoietic fraction of liver and is prepared under the supervision of a staff of biologists with ten years' experience in research work on liver extracts

In addition, each batch is clinically tested in hospital This ensures the high and consistent clinical activity which has made Neo-Hepatex an accepted standard in parenteral liver therapy the world over A copy of the relative clinical test chart is enclosed in each box

Neo-Hepatex may be administered in any dosage demanded by the condition of the patient its clinical potency enabling the clinician to give a more than adequate dosage in small volume

Neo-Hepatex is issued in Ampoules

Boxes of 6 x 1 cc - 5/- 6 x 2 cc - 7/6 3 x 4 cc - 6/6

The high potency of Neo-Hepatex renders it most economical in cost

Causes of Failure in Diagnosis

Fallacious findings are of two kinds (1) A normal shadow is demonstrated and at operation a pathological gall-bladder is found, (2) no shadow is obtained and at operation a normal gall-bladder is seen

The first type of error is usually found in association with the strawberry gall-bladder It has been suggested by A C Mooney (*British Journal of Radiology* 1935, 8, 403) that 'there is always an associated cholangitis of varying degree, and this latter is mainly responsible for the resulting changes in gall bladder structure which eventually produce disturbance in function The cholangitis is a result of an ascending bacillary or streptococcal infection from the bowel, passing up either directly along the duct lymphatics or being blood-borne by the portal system In the more common blood-borne infection the peritoneal and muscular coats are the first to be attacked Changes in the mucosa occur as a later development' Hence concentration of dye is not affected in the earlier stage of the disease and a radiograph may show a good gall-bladder shadow while at operation a diseased bladder is found Kirklin states that 'in approximately 10 per cent of normal responses from patients ordinarily selected for the test the gall-bladder is nevertheless diseased' Operative findings upon 287 cases with normal gall bladder shadows support his statements It would seem inevitable, therefore, that there will always be a percentage of errors in those cases showing normal shadows Statistics indicate that in this group the test is less reliable than in the pathological group where no shadow or only a faint shadow is obtained

Now the second type of fallacy—that is, no shadow and a normal gall-bladder—may arise from different causes

1 Defective liver function Insufficient dye may be excreted from a cirrhotic or carcinomatous liver to give any shadow in the gall bladder and yet the gall bladder may be unaffected

2 Achlorhydria in connexion with a hypotonic stomach and duodenum may be associated with a relaxed sphincter of Oddi and too rapid emptying of the gall bladder so that no concentration occurs

3 Gastric stasis with consequent failure of absorption of the dye

4 Vomiting immediately after ingestion of the dye

5 Failure on the part of the patient to carry out instructions

6 Chronic duodenal ulcer or chronic appendicitis

If these extraneous causes of error can be eliminated the absence of any gall-bladder shadow or a very faint shadow can be taken as a reliable indication of disease The actual percentage of error will vary in different clinics and with different workers Statistics of the Mayo Clinic to which Kirklin refers in a paper written in March, 1935, gave confirmation of the x-ray diagnosis, whether positive or negative in 95 per cent of the cases Dr Lysholm of Stockholm claims that in his clinic the average error is one in a hundred

I have tried to draw some conclusions as to the accuracy of the test in my own practice from 512 cases examined in two hospitals and in private practice during the past few years I do not claim that these figures are extremely good but they probably represent an average degree of accuracy In the rush of hospital x-ray work as it is carried out to day it is not easy to ensure that a perfect technique is always employed With constant changes in the nursing staff in the wards occasional errors in preparation occur and are difficult to avoid, and for this reason I find that the figures for private work are slightly better than those of the hospital x ray department

TABLE I

Description	No	Operated	Correct	Per cent.
Normally visualized	197	29	21	72.4
Faint shadow	92	37	31	83 7
No shadow	154	71	65	91.5
Stones	69	48	46	95 8
Total	512	185	163	88 1
Total cases reported pathological	315	156	142	91 0

Of the eight cases which gave fallacious x-ray findings in the first group small stones were found in three and gravel in one, mild cholecystitis was present in three, and in one the gall bladder was removed but no reason was given for its removal In all these cases the mucous membrane was healthy enough to allow of good concentration and a normal shadow

TABLE II—*Analysis of Surgical Findings in Cases Reported Faint Shadow*

Chronic appendix Normal gall bladder	3
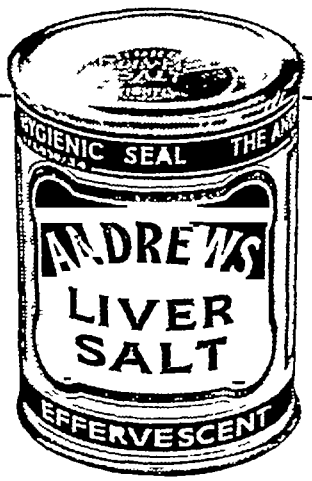
Chronic duodenal ulcer Normal gall bladder	1
Cirrhosis of liver	1
Empyema with stones	7
Adhesions around gall bladder and cystic duct	3
Normal gall bladder	2
Total	71

Conclusion

In conclusion I would like to say that the oral method was used in all my cases This is capable of giving a correct indication in nearly 90 per cent of cases as to whether the gall-bladder is normal or pathological The fact that 10 per cent of errors may occur is good reason for urging that the Graham Cole test should not be used to supplant the usual clinical methods of examination but should take its place as part of the ordinary routine investigation as a valuable aid in the diagnosis of cholecystic disease It should be remembered that the test is essentially a functional one, and in only a small percentage of cases can a differential diagnosis be made The success of the method depends upon the most careful attention to detail in preparation and to correct radiographic technique

ANDREWS LIVER SALT

combines the laxative action of



MAGNESIUM SULPHATE

with the pleasing qualities of an

EFFERVESCING SALINE

A NEW FEATURE

Each tin of Andrews is now sealed by a patented damp-and dust proof Cellophane Cap, which maintains original Laboratory condition making a good product even better

An 8-oz Tin will be sent free, on request, to any member of the Medical Profession.

Scott & Turner Ltd.
Andrews House
NEWCASTLE-ON-TYNE.

1 ANDREWS LIVER SALT is a pleasant-tasting effervescent aperient with tonic properties Its laxative action is due to the presence of magnesium sulphate and other salts, which, by their Osmotic action, induce the flow of water through the bowel wall from the surrounding tissues In this way, the walls of the bowel are thoroughly cleansed, and its contents are maintained in a semi-fluid condition, thus ensuring an easy painless evacuation

2 By removing from the system the poisonous waste food substances, which slow down the digestive process and impede the action of the liver, ANDREWS acts as a tonic to the whole system and is a valuable aid in maintaining perfect fitness

3 ANDREWS stimulates the flow of bile, and thus assists in the later stages of food assimilation and in destroying the toxins of faecal stagnation

4 It is ant-acid in action, and the carbon dioxide which is liberated when ANDREWS is dissolved in water has a sedative effect on the stomach and a physical cleansing action on the stomach walls It is, therefore, valuable in cases of indigestion, sickness and sick headaches

5 Rheumatism, when due to bowel sepsis, may be safely treated with ANDREWS LIVER SALT and the treatment of all forms of this disease is assisted by the effective bowel evacuation induced by ANDREWS

6 It relieves headaches caused by excessive intercranial pressure, by reducing the amount of fluid passing through the brain.

7 It may be used as a hydragogue purgative in the treatment of oedema, ascites, pleuritic effusions, and nephritis, and with safety even in failing cardiac conditions

8 In cases of fever, its brisk effervescing solution in water makes a refreshing and invigorating drink, quenching thirst, diluting the toxins, and relieving the strain upon the kidneys

9 It may be taken with perfect safety by the most delicate adult or child, and may be confidently used in pregnancy where the stronger purgatives might be harmful ANDREWS does not produce any violent disturbance in the system, nor does it affect the secretion of milk.

DOSE—as a laxative, the usual dose is two teaspoonfuls stirred into a glass of water and taken on rising in the morning or last thing at night, but this should be adjusted to individual needs and, in the case of children, graduated according to age.

Loss on ignition was measured by heating over a Meker burner to a constant weight

Antacid values were determined by adding a known excess (100 c cm) N/20 HCl to an accurately weighed amount of the sample (about 0 2 gramme) and incubating at body temperature for four hours, in which circumstances decomposition is almost complete The unused excess of acid was estimated by backward titration with N/20 NaOH These values as well as those for the adsorption of methylene-blue have been calculated on the basis of the ignited weight The actual clinical values are influenced by the amount of water (Table I, column 3), and consequently are lower

Adsorption—Exactly 0 2 gramme of the sample was washed into a 50 c cm test-tube and the volume made up to 20 c cm with distilled water, 25 c cm of aqueous methylene blue solution 0.2 per cent were added The corked tube was kept at room temperature and shaken several times a day At the end of fourteen days the unadsorbed excess of methylene-blue was estimated colorimetrically Adsorption continues for many days and is not complete before the end of two weeks The strengths and proportions were arranged to give saturation figures falling on the horizontal portion of the graph (Mutch, 1936) methylene-blue concentration in adsorbate against concentration in supernatant fluid, at equilibrium

FINDINGS

Water Content—The loss in weight on ignition represents all the free water and most of that combined When sepiolite is heated it loses water without decomposition up to about 600° C, when the diffraction radiograph indicates a change to enstatite (Migeon, 1935) Further losses occur continuously up to 1,000° C., when they cease and the radiograph changes to that of cristobalite, the molecular structure having been broken down completely and every trace of moisture having been driven off It will be seen that all samples contained water far in excess of that demanded by the theoretical formula The antacid and adsorption values have been calculated on the basis of ignited weight As already pointed out, in actual practice the powder received by the patient would contain a certain amount of water (Table I, column 3) and be proportionately less effective Any value above 30 per cent for water content must be regarded as needlessly high The adsorptive and antacid qualities of true sepiolite No 1 are in no way impaired by careful drying down to a water content of 25 per cent or even less Undesirable dilution is particularly noticeable in sample 12

Magnesia Silica Ratio—In pure sepiolite the gravimetric ratio between the MgO content and that of SiO_2 is 1 2 24 Any increase in this ratio represents contamination with free silica or the presence of one of the higher silicates A decrease in the ratio represents admixture with free magnesia or the presence of some silicate with a higher magnesium content such as french chalk The ratios observed are given in Table I, column 5 The discrepancy between each sample and true magnesium trisilicate is indicated by the data in column 6 In certain instances the product conforms closely in general composition to the demands of the theoretical formula Other products depart widely from these primary requirements Clearly much material contaminated with large amounts of free silica sometimes in almost equimolecular proportion, has been supplied when magnesium trisilicate has been prescribed

Antacid Value—The antacid properties are affected adversely by the presence of an excess of silica For example, the crudely siliceous sample 13 was little more than half as potent as the correctly proportioned sample 1 Two drachms of sample 13 must therefore be prescribed to secure the same neutralizing effect as one drachm of the standard material Conversely the antacid action is increased by adulteration with magnesium oxide In such an event, however, the adsorption potency suffers and the valuable property of lag in the rate of neutralization is partly lost Sample 7 illustrates the falling off in adsorptive power which occurs when magnesium is present in excess of the theoretical requirements

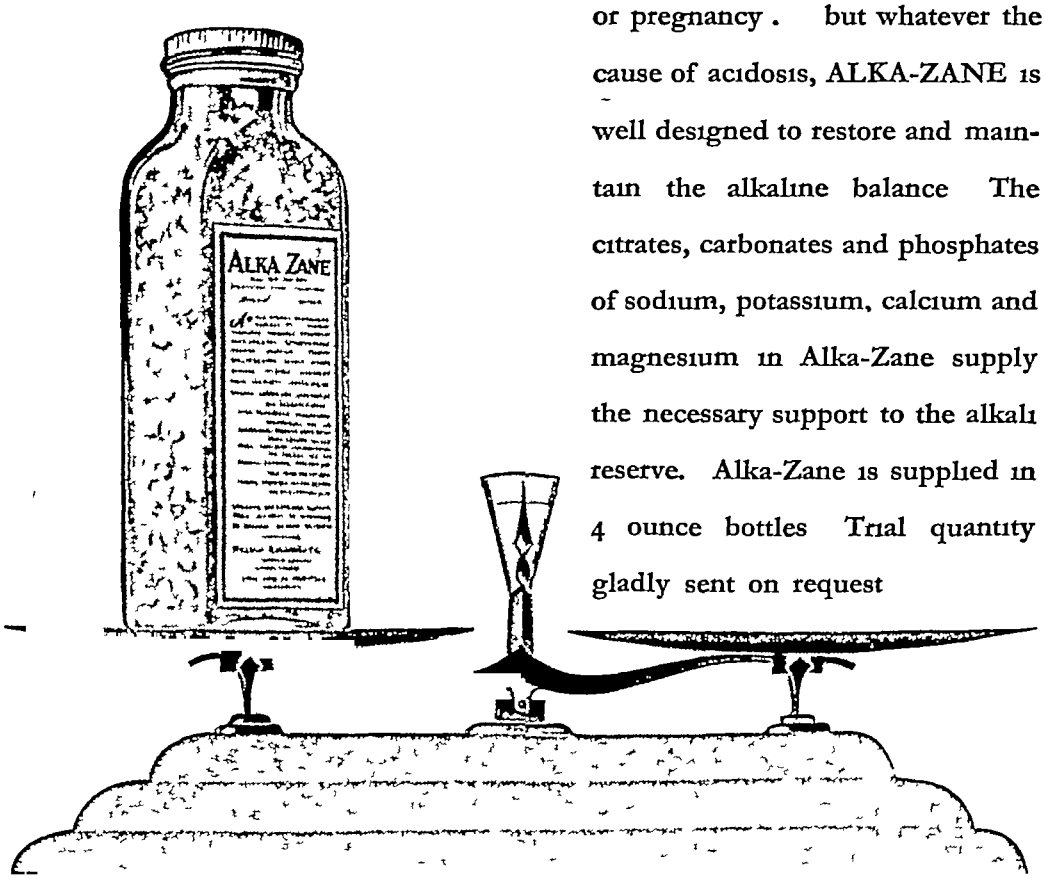
Adsorptive Value—This is dependent upon a number of factors many of which are still obscure In the series of siliceous magnesias surveyed the action is greatest in those products which conform most closely in chemical composition to the formula $2MgO\ 3SiO_2\ nH_2O$ Contamination with an excess of either constituent is associated with a falling off in adsorptive power—for example, sample 13, with its almost incredibly high silica content, possesses the feeblest adsorptive value of all

Clinical Utility

All clinical observations carried out at Guy's Hospital during the last two years (1935 and 1936) have been made with true artificial sepiolite No 1 (brand magsorbent), which conforms accurately to the dictates of the theoretical formula and yields the pure diffraction radiograph of the natural mineral It is completely insoluble in water and its intrinsic particle size is of a fine colloidal order Its applied pharmacological properties include

1 The combination of a useful total antacid potency with a slowness in the rate of interaction with hydrochloric acid of gastric strength

2 The provision for strong adsorption effects externally or in the stomach and intestine through the medium of (*a*) any unneutralized excess of sepiolite, (*b*) colloidal silica produced during interaction with gastric acid in accordance with the equation



$$Mg_2Si_3O_8\ 2H_2O + 4HCl = 2MgCl_2 + 3SiO_2 + 4H_2O$$

Continuous Control of Gastric Acidity—It is estimated that the daily secretion of gastric juice corresponds to 1½ to 3 litres of 0 3 per cent HCl The average 2½ litres can be neutralized in the laboratory by about 2½ litres of milk or 230 grains of dried sodium bicarbonate In the stomach the problem is complicated by varying rates of secretion and constant loss through the pylorus Kark and Davis (1936) found that even 50 per cent more milk than that theoretically needed, given hourly as 5 oz. feeds, failed to control gastric acidity Free HCl at times rose to 0 1 per cent and the total acidity to the equivalent of 0 2 per cent HCl W N Mann (1937), also working at Guy's Hospital, confirmed this inadequacy of simple neutralization with milk He then administered true artificial sepiolite hourly and found a complete absence of free HCl over a period of eight hours The gastric tube was kept in place continuously throughout this period and the stomach contents were sampled every thirty minutes

These observations confirm and amplify the earlier observations on fractional test meal graphs (Mutch, 1936b) Two factors make possible this exercise of complete and continuous acid control on a spaced scheme of dosage First, the slowness of the interaction between

There is many a cause for ACIDOSIS

It may be a common cold or any febrile disease, it may be nephritis or liver disorder, general anæsthesia or pregnancy . but whatever the cause of acidosis, ALKA-ZANE is well designed to restore and maintain the alkaline balance The citrates, carbonates and phosphates of sodium, potassium, calcium and magnesium in Alka-Zane supply the necessary support to the alkali reserve. Alka-Zane is supplied in 4 ounce bottles Trial quantity gladly sent on request

ALKA-ZANE

WILLIAM R WARNER & CO, LTD, POWER ROAD, CHISWICK, LONDON, W.4

acid after fourteen days' contact when the *p*H is still as low as 3 5 Fig 2, showing the acidity day by day, indicates that an indefinitely long period would be required to secure much diminution in acidity below *p*H 3 6 Neutrality can only be achieved by adding more sepiolite With N/20 HCl a 10 per cent excess of sepiolite is required to approach this end Fig 3, giving the seven-day *p*H reading of mixtures containing N/20 HCl and graduated excesses of sepiolite, demonstrates that even with a 50 per cent excess of sepiolite a slight acidity persists at the end of a week Other factors which influence dosage are the volume and strength of the gastric juice, the rate of loss through the pylorus, the degree of duodenal regurgitation, and the completeness of the result

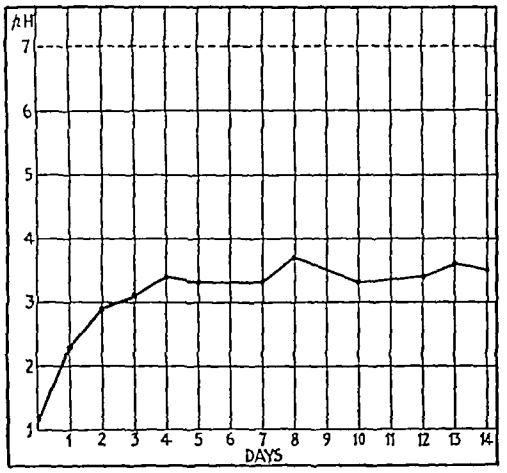


Fig 2—Acidity of Mixture containing Equivalent Weights of Artificial Sepiolite (Magsorbent) and N/20 HCl (Note (1) substantial lag in neutralization , (2) that final balance does not approach the neutral point)

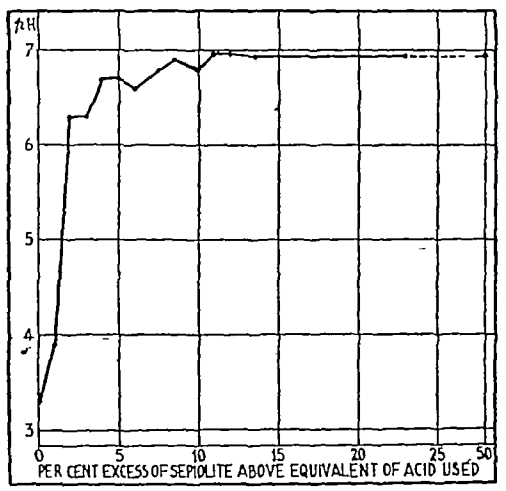

Fig 3—Influence of an Excess of Artificial Sepiolite (Magsorbent) on the Final Acidity of Mixtures with N/20 HCl (*p*H measured after seven days at room temperature)

however, be taken as a basis on which to estimate the probable requirements of other patients Another observation which must influence selection of the dose for particular cases is that the rate of interaction and the completeness of neutralization both fall off rapidly as the strength of the acid diminishes For example, using a substantial and constant excess of acid of various strengths (100 c cm N/20 HCl or its equivalent and 0 15 gramme

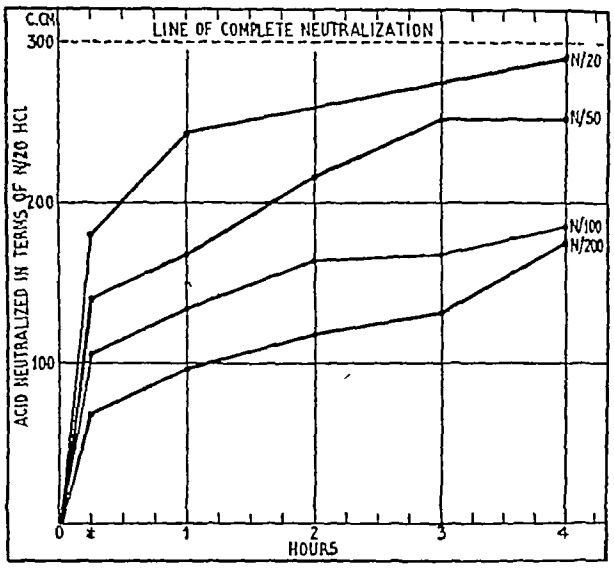

Fig 4—Neutralization Lag at Various Acidities Sample 1 using 1 Gramme Sepiolite 1 (Magsorbent) Ignited Weight, plus Marked Excess of Acid

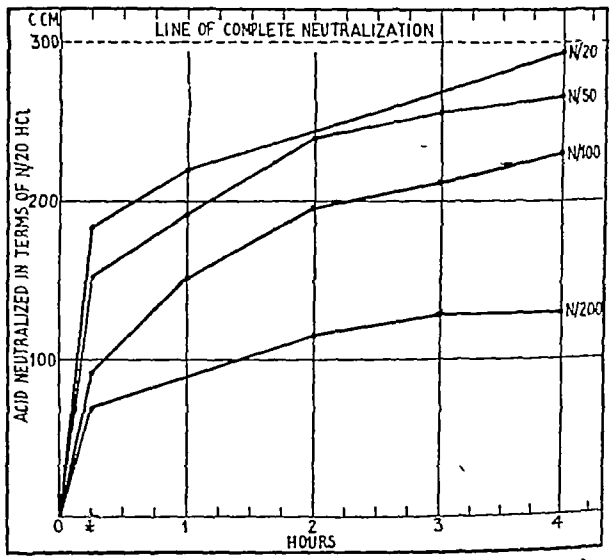

Fig 5—Neutralization at Various Acidities Sample 2 using 1 Gramme Sepiolite 1 (Magsorbent) Ignited Weight plus Marked Excess of Acid

desired Fortunately the substance is non-toxic and non-cumulative and does not cause alkalosis so that if absolute anacidity is sought for doses can be increased without stint W N Mann found in his case of gastric ulcer that one drachm hourly was sufficient to abolish all free HCl from the stomach for a period of eight hours Such complete neutralization is widely recognized as advantageous in the treatment of chronic peptic ulceration, but is rarely required in other cases If kept up long enough it would inevitably be detrimental Mann's data can,

sepiolite, ignited weight) and estimating the residual acid at various intervals by backward titration, it was found that after one hour N/20 HCl had used up about 75 per cent of the sepiolite, N/50 HCl had used 60 per cent N/100 HCl had used 47 per cent, whilst the N/200 acid had interacted with only 33 per cent, so that at the lowest acidity two thirds of the dose remained unutilized after one hour and about one half was still undecomposed at the end of four hours Automatic adjustment to the conditions in the stomach must clearly occur Full details

"The Vitamin B_1 activity is assured

by biological assay of *every day's output*"

So far as is known, there is only one food product for which such a claim, involving no fewer than 250 biological assays for Vitamin B_1 per annum, is or can be made

Unnecessary? Consider this

"*Unselected yeasts may vary tenfold in their vitamin B content*"—(*J. Nutrition*, 3, 257)

"*Unselected wheat germs may vary fivefold in their vitamin* B_1 *content*"—(*J. Hygiene*, 37, 303)

Statements as to the Vitamin B_1 potency of foods, etc, couched in general terms, are unacceptable for therapeutic purposes unless supported by (1) an assay of each lot manufactured (2) a guarantee that the potency will not diminish with the passage of time

How then can the physician make sure that his patient receives, in a natural form, any desired amount of vitamin B? Only by prescribing Bemax

BEMAX

A unique natural source of accessory nutritional factors

Vitamin B_1—400 International Units per ounce.

Vitamin B_2—Flavin present.

Vitamin B_6—(Anti-dermatitis) One of the richest sources

Vitamin A—280 International Units (as Carotene).

Vitamin E—the richest natural source,

Phosphorus—330 mg per ounce,

Magnesium—99 mg per ounce,

Iron—3 mg per ounce and Copper—0·45 mg per ounce.

TUBERCULOSIS OF THE CERVICAL LYMPHATIC GLANDS

BY

R REID, M S Lond , F R C S

Consulting Surgeon

AND

M C WILKINSON, M B Lond

Medical Superintendent

Essex County Council Sanatorium Black Notley

Tuberculosis of the lymphatic glands is a disease that tends to run a long and debilitating course, but shows also a disposition to undergo natural cure when the patient s resistance can be assisted by his circumstances and environment The disease was recognized centuries ago as the king s evil, and was cured then by the royal touch To day there is unanimity of opinion that many varieties of treatment may achieve success, but that certainty of this is assured by none The authors, therefore, while recognizing that different methods may be employed with equally excellent results by different workers, wish to set out a method of treatment based on the pathology of this disease that has achieved a fair measure of success in a reasonable amount of time

The review deals with 119 consecutive cases of tuberculous cervical adenitis treated in Black Notley Sanatorium (Essex County Council) over a period of six years The patients have been drawn from town and country alike, and both sexes and all ages have been accepted Some had already received treatment by operation or other means before admission, but the majority were new and untreated cases In general the treatment has consisted of a combination of constitutional and operative measures , in the last four years there has been less delay in submitting patients to operation where such was indicated, but constitutional treatment has been the fundamental factor, and in no case was surgical extirpation of the tuberculous glands adopted as a primary measure

Sex Age Groups

It will be seen from the table given below that seventy out of the 119 cases fall into the 6 to 15 years decade, and that the vast majority occur in childhood and adolescence, before the lymphatic system undergoes its natural decline

Age	Male	Female	Total
11–15	12	17	29
0– 5	8	7	15
6–10	24	17	41
16–20	4	11	15

Family History

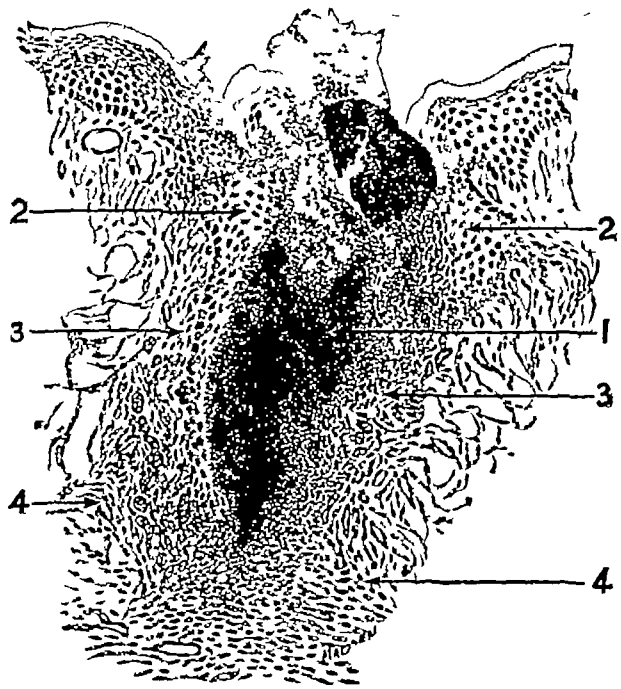
In this series of 119 cases there was no family history of tuberculosis in seventy-one, in twenty-five cases no note was made but there is good reason to believe it was negative and in the remaining twenty-three cases the following was elicited there was a history of phthisis in the family in nineteen cases of glands in the neck in two cases, of tuberculosis of the knee in one case, and of tuberculous meningitis in one case Thus in this series only 16 per cent of patients had a near relative suffering from phthisis This fact bears out the observation that the human form of bacillus is relatively uncommon in tuberculous glands Many investigators have estimated the frequency of bovine tuberculosis in this disease affecting the cervical glands, and the following is a summary of their findings Scotland, 90 per cent , England, 65 per cent , U S A , 54 per cent , Germany, 25 per cent

Tonsillar Sepsis

The cervical lymphatic glands drain the tonsil and lymphatic tissue of the nasopharynx, the first tissue to come into contact with ingested tubercle bacilli If the lymphatic tissue of the nasopharynx and tonsil is unhealthy, and if as a result the cervical lymphatic glands are also abnormal, it may be that the frontiers are left poorly guarded against invasion of tuberculosis, which will then become established in the cervical glands Howarth and Gloyne (*Lancet* 1923, **1**, 1202) found that the tubercle bacillus was present in the tonsil in about 5 per cent of 300 cases of tonsillectomy in patients with cervical adenitis Howarth stated that tuberculosis was a late and superadded infection upon a gland damaged as a result of focal sepsis in the drainage area

Of the 119 cases in this series eighty-five had a history or signs of tonsillar disease, in twenty one cases only the throat was normal, and in thirteen cases no note on this point was made Of the eighty-five patients with abnormal tonsils thirty one had been treated by tonsillectomy prior to admission, and twenty-two had their tonsils and adenoids removed during their stay in the sanatorium In the remaining thirty-two cases, although the tonsils were not normal, for various reasons no tonsillectomy was performed The findings in this series therefore tend to support the theory that disease in the lymphatic tissues of the nasopharynx is an important factor in the aetiology of tuberculous glands of the neck

Pathology



Sources of tubercle bacilli other than the exhalations and sputum of consumptives and the milk from tuberculous cows seem to be of little importance, and from the frequency of bovine tuberculosis it may be concluded that milk is the great vehicle of infection All evidence is in favour of the bacillus entering through the tonsil or surrounding lymphatic tissue and passing thence to the lymphatic barrier in the glands of the neck As would be expected, the upper carotid chain is the group most often affected, although glands in the posterior triangle and the supraclavicular regions are not uncommonly involved, and it is not unusual to find evidence of disease in more than one group of glands in the neck In only one case in this series was the cervical adenitis part of a generalized tuberculous lymphadenitis, this condition occurring typically in a negro child

An interesting fact in this series is that in no case was the disease found to exist beyond the lymphatic system, and no case has shown secondary lesions such as pulmonary or bone tuberculosis In tuberculosis of the lymphatic system there are evidences of great powers of resistance to the infection, and it may be that not only can this system withstand and overcome an infection which is not too heavy, but that such infection successfully protects the individual throughout life

The tubercle bacilli, having established themselves in the affected gland, produce their characteristic lesions, and

Underlying All Inflammation . . . *is change in the Capillary Net-work*

Lessened resilience and permeability of the capillary wall, stasis in capillary channels, cause a decrease in tissue nutrition, lowered local resistance, and serious damage to the tissue cells.

general rule the success of aspiration in the treatment of a tuberculous abscess depends upon the employment of a technique in which the needle is passed into the abscess cavity through and across muscle The needle track is thus closed by the approximation of the muscle fibres We are indebted to Sir Henry Gauvain for instruction in this technique In the neck this technique can rarely be used, as the abscesses are superficial and the needle cannot be inserted across the muscle Furthermore, the pus in these cervical glandular abscesses is often caseous and does not aspirate readily through a needle, or, when it does, the aspirated cavity is small and refills so quickly that aspirations have to be repeated very often, and in spite of them the abscess frequently breaks down The authors therefore reserve aspiration for all other forms of tuberculous abscess, but when it appears to be unlikely to succeed in the treatment of a tuberculous glandular abscess they empty the abscess through a small incision by means of gentle curettage and then re suture the wound The risk of secondary infection following this procedure is small, possibly because the tuberculous granulations which form a good nidus for organisms of secondary infections have been removed The wound does not often heal by first intention, but the operation is followed by subsidence of periadenitis and in the size of the gland mass, and subsequent radical operation if performed is considerably facilitated

There is a type of tuberculous skin involvement due to the breaking down of a tuberculous gland beneath the skin An ulcer is formed the base of which consists of a deep layer of tuberculous granulations, these may be treated by "brass paste,' as recommended by Sir Henry Gauvain This paste causes sloughing of the granulations, leaving the ulcer bare, clean, and healthy Alternatively, curettage of the granulations may be performed

Radical Operative Treatment

The operation for radical excision of tuberculous glands of the neck is a controversial field in surgery There is no doubt that it has produced many unsatisfactory results, due chiefly to the sequelae of recurrence, persistent sinus, muscle palsy, and ugly scars Some of the cases in this series had been previously operated upon by radical excision with bad results The causes of this failure can be almost wholly attributed to ill-advised operation before general treatment had converted the case from Group 1 stage to a stage of less activity If operations are attempted in the presence of periadenitis it will be found that the difficulties are very great, larger incisions are required, and diseased glands may be missed and nerves injured The main contraindication for the operation, therefore, is active disease with periadenitis

Anaesthesia

The anaesthetic must be one which can be administered without obstructing the surgeon A basal anaesthetic with gas and oxygen is suitable, therefore, but at times it causes considerable venous congestion of the neck Open ether, general contraindications being absent, is on the whole the most satisfactory anaesthetic, as there is less congestion and administration is simple and not complicated by bulky apparatus It has already been noted that pulmonary lesions are rare when there is tuberculous disease in the neck glands

Operation

The neck is turned to the sound side and an anaesthetic screen erected A natural transverse crease in the neck over the tumour is chosen and a transverse collar incision is made, including any sinus or diseased skin that may be present If the mass is extensive it is more satisfactory from the cosmetic point of view to make two or more transverse incisions, rather than a vertical one The vertical incision, however restricted, produces a poor cosmetic result, and full exposure can be given by the transverse incision The cut divides the platysma the flaps are then dissected upwards and downwards, and a self-retaining retractor is inserted If a sinus leading to the gland is visible, dissection of the gland is simplified by passing a director into the sinus and pulling up the gland In any case the sterno mastoid muscle is dissected backwards off the mass and partly divided if necessary The mass of glands is then pulled *backwards* and the fascial tissue on its anterior margin picked up and dissected forwards close to the gland until a line of cleavage is found Gauze dissection will then sweep this fascia off the glands, and vessels will be identified and tied As the gland is pulled upwards and backwards and dissection continued the internal jugular vein will be seen This can be peeled off the glands, never being firmly adherent The mass is then pulled down, and further dissection with scissors and gauze close to the gland reveals the posterior belly of the digastric muscle The mass is cleared from this and gauze is packed into the depth of the wound Next the sterno-mastoid is retracted and cleared off the mass, here, high up, the spinal accessory nerve will be seen entering the deep surface of the muscle In order to clean and preserve it, division of the mass may be necessary The gauze plug is now removed and in the depth of the wound the jugular vein and its anterior tributaries will be seen with the digastric muscle above The gland mass is next dissected upwards towards the skull until the uppermost gland is reached Above this the pedicle is clamped and the mass removed It is essential that all glands which are enlarged and firm or caseous should be removed Soft seedling glands may be left, and dissection need not be carried far afield to clear the chain, provided that no hard white glands are left If in any part of the operation the gland mass is found to be ill defined and to involve important structures injury of which would be prejudicial to the patient it is best to avoid risk of injury by curetting the affected part, as small residual areas of caseous tissue are not likely to prevent healing by first intention or to cause recurrence of disease if sufficient constitutional treatment has been given When haemostasis has been secured the deep space is closed as far as possible by fine deep sutures, the platysma is united with the same material, and the skin closed with ophthalmic salmon-gut A drain inserted for twenty-four hours in the posterior part of the wound is useful in preventing a haematoma, which may organize if any residual space is left Stitches are loosely tied and are removed in four days, if this is done and the platysma properly sutured the cosmetic results should be excellent

Analysis of Immediate Results

Before examining the tabled results below certain facts should be borne in mind

1 The cases are grouped according to their state on admission

2 Under the heading of conservative or constitutional treatment are included all surgical measures except formal excision

3 Formal excision was required for the more intractable cases, therefore the duration of treatment is not a

Cod Liver Oil

is the Liver Oil with the

OFFICIAL BACKING OF THE MINISTRY OF HEALTH AND LEAGUE OF NATIONS NUTRITION COMMITTEE

As every practitioner knows, no other liver oil has such a record of achievement as Cod Liver Oil For it contains Vitamins A and D in the right proportion In fact, the study of vitamins originated through Cod Liver Oil Its only drawback in the past has been its taste Now this difficulty has been overcome "SevenSeaS" provides, *for the first time*, Cod Liver Oil in a palatable form—so palatable that it can be taken with ordinary foods, and it is available in "High Potency" form, too

"SevenSeaS" is obtainable in three forms (1) "High Potency" Oil—four times "B P" standard, (2) "High Potency" Capsules containing 5 mm dose of "High Potency" Oil, (3) Standard "B P" Oil We would like all practitioners to prove "SevenSeaS" "High Potency" Cod Liver Oil to their own satisfaction Please send to the address below for a free sample

unsatisfactory An interesting feature in late results is that no fresh foci of tuberculosis had been found to develop in any case This supports the view that the lymphatic tissues of the body form a barrier to invasion by the tubercle bacillus, and when invasion is met with in this site blood-stream infections do not occur This is also compatible with the fact that traces of old cervical adenitis are rare in cases under treatment in the sanatorium for tuberculosis at other sites

Causes of Failure

Among the causes of failure must be included the type of gland already mentioned which becomes palpable owing to mechanical reasons, perhaps many months after a more superficial mass has been removed True recurrence of the disease, however, is indicated only by the fresh development of tuberculosis in a gland previously unaffected In this series cases of failure have been found to be due most commonly to incomplete treatment Either the constitutional treatment was inadequate or excision was not carried out when it should have been In at least one case tonsillectomy was omitted and the infected tonsil was the cause of failure The following cases are quoted to illustrate the various causes of failure

1 INSUFFICIENT CONSTITUTIONAL TREATMENT

Case A a Man aged 30—This patient was admitted with a breaking-down gland in the right posterior triangle there was much periadenitis After some weeks the periadenitis had subsided at operation the gland mass was incompletely excised as there was some spread by abscess formation which was not clearly defined The operation was finished by curettage The wound healed by first intention in fourteen days As the patient was anxious to return to business he was then discharged One year later he developed a fresh tuberculous gland in the right submaxillary region There was no trace of disease at the site of the previous lesion

Case B a Boy aged 6—Admitted from a hospital where inadequate tonsillectomy had been performed There was a mass of tuberculous glands behind the left sterno mastoid These were removed, and after four months treatment in all the patient was discharged He was readmitted a year later with an enlarged left submaxillary gland showing calcification The tonsil on the left side was very unhealthy During his second admission to the sanatorium tonsillectomy was performed and the left submaxillary gland removed The causes of failure in this case were inadequate constitutional treatment in the first instance and failure of the original tonsillectomy

Case C a Boy aged 6—Admitted suffering from tuberculous cervical adenitis with periadenitis and ulceration After three months conservative treatment this had subsided considerably, and it became necessary to transfer the child owing to pressure of beds *The parents refused this and* took the child home Recurrences subsequently occurred, requiring further treatment This case should perhaps not be included in the series as treatment was not completed in the first instance

2 CASES IN WHICH CONSTITUTIONAL TREATMENT FAILED OPERATION SHOULD HAVE BEEN PERFORMED TO COMPLETE CURE

Case A a Boy aged 5—When admitted the patient had a large mass of left submaxillary glands with periadenitis and ulceration Ten months constitutional treatment was given and he was discharged with a persistent gland which broke down again later This was a failed constitutional treatment case which should have been treated by surgery at the Group 2 stage

Case B a Girl aged 12—Admitted with breaking down gland in the left side of the neck. After six months constitutional treatment she was discharged with a small hard gland which lay at the bottom of a healed sinus Afterwards the sinus reopened this would not have occurred if the gland which had reached the Group 3 stage had been removed before discharge

3 CASE IN WHICH TONSILLECTOMY SHOULD HAVE BEEN PERFORMED

A Girl aged 12—When this patient was admitted she had a small mass of glands in the posterior triangle which healed well after seven months' constitutional treatment The tonsils were unhealthy, but were not removed Four years after discharge there was recurrence at a fresh site in the submaxillary region The patient was readmitted and tonsillectomy performed, with excision of glands

4 CASES IN WHICH CAUSE OF RECURRENCE IS NOT KNOWN

Case A a Boy aged 14—Admitted with multiple discrete glands in both sides of neck, the size of marbles He had had five previous operations, and the diagnosis of tuberculosis had been proved by pathological examination He was treated by constitutional measures including a plaster collar, for five months and excision of glands on both sides of the neck was performed He was then sent to a special school in the country On his return home, however, recurrence started in the glands These were of the non-caseating type

Case B a Woman of 25—This patient had had three operations for tuberculous cervical glands, followed by constitutional treatment at the sanatorium on each occasion A recent report states that there is a fresh recurrence of tuberculous glands

Conclusions

In our opinion the conclusions below summarize our experience of tuberculous glands of the neck derived from the collection and study of the cases forming this series

1 The nasopharyngeal lymphatic tissue is the probable path of entry for the tubercle bacillus in this disease

2 Tuberculosis of the cervical lymph glands is a local disease which does not give rise to metastatic lesions

3 Treatment is basically by constitutional methods aided at the proper time by active surgical procedures

4 When treatment is carried out according to the above plan results are satisfactory

Our thanks are due to Sir Henry Gauvain under whose supervision the work has been done and to Dr W A Bullough and the tuberculosis officers of the Essex County Council for their information concerning the present condition of the patients in the series

---

An interesting case of lead poisoning is described in the annual report on the health of the city of Sheffield, the cause of the poisoning being contaminated beer It was found that the patient had been a frequent customer at an establishment where beer was conveyed from barrel to beer pump through lead pipes Of samples of the beer which had remained in these pipes overnight one specimen showed a content of lead of one-third of a grain per gallon of beer Immediate action by the health department resulted in the replacement of the lead pipes by others of suitable material Other breweries and licensed clubs in the city were notified of the danger and undertakings to discontinue the use of lead pipes within a reasonable time were given The mortality rate from diphtheria during the year was the highest since 1915 A record number of cases (1,951) were admitted to the city fever hospital In the majority of the severe cases the 'gravis' type of *C diphtheriae* continued to be isolated It was found that these cases tended to become toxic at a very early stage Of eighty four deaths thirty-seven occurred in cases which had received antitoxin within the first three days of the illness

Normal for the hospital calculated from 1 927 consecutive cases grouped	1 927	939	48 72	148	7 68	792	41 1	48	2.49

Group B was found Fifteen of Group AB and twenty-six of Group B were included in this series of 228 cases The remainder were 100 Group O and eighty-seven Group A The percentages of this series were thus O, 43 85, B, 11 4, A, 38 15, AB, 6 6 The cases of pernicious anaemia alone numbered 193, and showed 41 45 per cent of Group O, 12 95 per cent of B, 38 9 per cent of A, and 6 7 per cent of AB

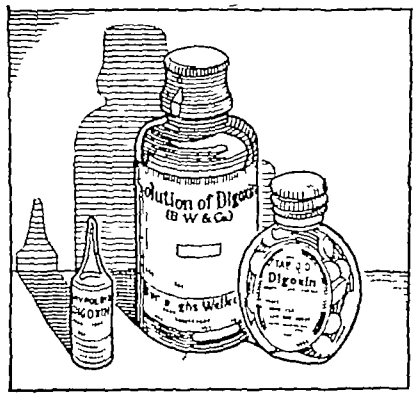
It is seen that Groups O and A approach one another very closely, Group A remaining roughly about the normal 41 per cent and if anything, a degree or two under (the normal figures for the hospital are given in the table) Group O is well below the normal, 48 per cent It is also noted that the rarer Groups AB and B are higher in numbers and percentages than normal—Group B almost twice and Group AB thrice the normal percentage It was also noted clinically that in the latter groups the severest manifestations of the blood diseases often were generally evident From this high incidence of the Groups AB and B in the blood diseases dealt with in this article one would like to make the statement that people falling into those blood groups are more susceptible to those diseases than people in the other groups, but, of course, to do so and to eliminate the element of coincidence would require much more intensive examination of a very large series of cases—into the thousands or tens of thousands if possible

In the second category only sixty-five cases were available This category included those diseases diagnosed as haemolytic anaemias of various types acquired or hereditary (acholuric jaundice, etc) with corresponding blood abnormalities, and with or occasionally without an enlarged spleen A similar type of percentage chart to the above was again observed, but the similarity was not so marked The figures were 46 2 per cent of Group O, 9 2 per cent of B, 40 per cent of A, and 4 5 per cent of AB

The third category, and the smallest, included the leukaemias (lymphatic, myelogenous, and monocytic types, chronic or acute) In all only twenty-four cases were available Among those were three of Group B and one of Group AB The proportions were 50 per cent of Group O, 12 5 per cent of B, 33 3 per cent of A, and 4.2 per cent of AB

The latter percentages are strikingly like those given by the series of carcinomata grouped On this observation one would like to conjecture some association between those two classes of disease—but of course that would be ridiculous on such small evidence A point which should perhaps be made here is that in the hospital in which this work was done the proportion of cases of blood diseases may be higher than in the average general hospital

The Neoplasms



The neoplasms were also treated in three categories, the last, the biggest, was included because of the large numbers of cases of intracranial tumours available which were grouped, in the majority pre-operatively

The first category included the carcinomata, and ninety two cases were grouped There were 53 3 per cent of Group O, 9 8 per cent of Group B, 32 6 per cent of Group A, and 4 3 per cent of Group AB

The second category included the sarcomata, but only fifteen cases of the latter were available These were nine of Group O and six of Group A

Digoxin (B W. & Co.)

THE MOST RELIABLE
CRYSTALLIZED
DIGITALIS PRODUCT

Digoxin is isolated from leaves of *Digitalis lanata* which is much more active therapeutically than *Digitalis purpurea*

Pure Precise analytical methods of the laboratory control purity eliminating necessity for biological tests

Stable Unlike tinctures of digitalis Digoxin is definitely stable both in solution and as 'TABLOID' DIGOXIN

Reliable. Offered to the medical profession with the advantages of authoritative clinical evidence in its favour

Rapid in Effect Orally or intravenously in all conditions in which digitalis therapy is employed

but the blood pressure was normal She was admitted on that day to the Brighton Maternity Hospital

On admission it was found that pregnancy corresponded to thirty-six weeks The blood pressure was 125/90 There was no albumin in the urine, but considerable oedema of the ankles was present, and visual disturbances were complained of No other abnormal signs were observed On March 16 the membranes were ruptured artificially this was followed on the 17th by some pain and a one finger dilatation of the cervix On March 19th the patient was fully dilated at 2 30 a m, and the delivery of a live female child followed The placenta was delivered fifteen minutes later The puerperium was uneventful

Summary

This case is of interest as being one of irregular menstruation amounting almost to amenorrhoea in which the menstrual cycle became normal following progynon treatment In addition the sterility which had formerly been present was relieved About the thirty-sixth week of pregnancy pre eclamptic symptoms became manifest, and it is felt, in view of the present theories as to the pathology of eclampsia, that this is of special interest in association with a case of known hormonal imbalance

Robson and Paterson, in a paper published in the *British Medical Journal* (1937, **1**, 311), give an account of their treatment of twelve cases of pre eclamptic toxaemia, using corpus luteum hormone (proluton, Schering) These authors state that clinical improvement appears to have been produced in these cases and that they believe the results to be sufficiently encouraging to warrant tests being made on a wider scale without delay

Discussion

In this case the patient s follicular hormone was substituted by progynon-B oleosum The signs of hormonal lack were overcome and the patient returned to normal During pregnancy this substitution was discontinued and a pre-eclamptic condition developed It is thought that this may give a clue to the cause of those eclampsias which have no premonitory toxaemic period and also of eclampsia in general

It is possible that there are two factors in eclampsia First, the renal or toxaemic factor, and, second, as a result of this poisoning, a resultant damage to the hormone-producing system It was this hormone lack that caused the symptoms in the above case

This theory also accounts for the fact that emptying the uterus does not cure eclampsia, for it is the lack of hormone that causes the condition and not merely the presence of a toxic substance

I wish to acknowledge the help of Mr K F Mackenzie, under whose care the patient was in hospital My thanks are also due to Messrs Schering for the supply of progynon and to Dr H Neumann for suggestions as to dosage

Petworth Sussex W Antony Ball M B, B S Lond

The Princess Royal on October 2 opened two new wings of the nurses home at the General Infirmary at Leeds She was received by her husband, Lord Harewood, in his capacity as president of the hospital Mr A P Nicholson the chairman, said that when the success of the appeal for £250,000 for extensions and improvements was assured the first work put in hand was the nurses home A new out-patient department was being built, and a new wing for paying patients, also a large *x*-ray department Dr G W Watson chairman of the Medical Faculty, thanked the Princess for her interest in this great undertaking and for her attendance that afternoon

Reviews

DISEASES OF THE LARYNX

The Larynx and its Diseases By Chevalier Jackson, M D, Sc D, LL D, F A C S and Chevalier L Jackson, A B M D, M Sc (Med), F A C S (Pp 555, 210 illustrations, 11 in colour 35s net) Philadelphia and London W B Saunders Co 1937

The industry of Dr Chevalier Jackson and his son is once again brought to notice by the publication of a joint work on the larynx and its diseases It is naturally impossible to determine or even to guess the precise share in authorship of the two writers, but it is quite evident on reading the book that every page is pervaded by the immense clinical experience and wisdom of the elder Jackson, and, although the claim that the book is new is justified by the new illustrations and the new writing, the familiar opinions and teachings constantly reappear There is in consequence not a great deal that calls for comment in one direction, for there is nothing particularly novel, but in another direction the fullness of the descriptions, the magnificent new coloured plates and other illustrations with which the book is liberally adorned, must excite admiration and satisfaction that Dr Jackson has collected all that he has to say about the larynx between the covers of a single volume

The Jacksons are gently apologetic for the style of writing and deprecate any effort towards the finish of a Macaulay, but the style is the Jackson style, and it is well that it should remain itself and attempt no imitation' The same is true of the illustrations, even of those which are photographic reproductions, and when on page 458 Dr Jackson is seen sitting in the corner of an automobile gazing at a hideous rag doll beside him, and then taking it across his knee to perform tracheotomy, no flicker of a smile is visible

In a few matters of detail the reader is left with a vague impression—for example, in the definition of contact ulcer This disease is Dr Jackson s own, and although it is beautifully illustrated with a coloured plate all to itself and fully described, and carefully differentiated from pachydermia, yet the reader is left to wonder what this curious disease really may be Mostly, however, the opinions and the statements are definite enough, and the authors have managed even to be quite clear on the subject of precancerous conditions To deny their existence is to confess insufficient clinical experience, and so far as the larynx is concerned this difficult question has been admirably clarified The authors use the words pachydermia, keratosis, and leukoplakia with clearly defined separate meanings which are of great assistance to a proper understanding

There are revealed naturally certain differences in the importance or incidence of types of cases presenting themselves in the United States For example, chronic laryngeal stenosis cannot be so common in Great Britain as it appears to be both on the continent of Europe and in America, but it is probably diminishing in America also, as the profession there has been gradually educated not to perform high tracheotomy

Where everything is so modern and the authors are so entirely independent and reliant altogether on their own experience and opinions, it seems strange to discover them in the part of *laudatores temporis acti*, but that they regret the passing away of Prohibition there can be no doubt, and they look forward to a higher incidence of

CHOLECYSTITIS *

BY

J W McNEE, D S O, M D, D Sc, F R C P Lond

Regius Professor of Practice of Medicine University of Glasgow Consulting Physician University College Hospital London

The subject of gall bladder infection has been discussed in recent years at many times and in many places, especially by hospital physicians and surgeons It is a good choice for discussion at an Annual Meeting of the British Medical Association, because its great frequency and clinical importance may then be emphasized to the general practitioner, who after all, has the main opportunity and responsibility of recognizing inflammation of the biliary tract in its earliest and most important stages

The combined results of many observations, by physicians, surgeons and pathologists seem to show without any doubt that disease of the gall bladder is now the commonest of all organic troubles of the digestive tract This has been repeatedly stated by Sir Arthur Hurst and he will no doubt speak on this point to-day Statistics in different countries and in different clinics must vary, but Piersol (1936) has recently published an analysis of the admissions to the gastro intestinal clinic of the University of Pennsylvania Hospital, Philadelphia and shown that 16 3 per cent of all the patients were diagnosed as suffering from gall bladder disease Duodenal ulcer, cancer of the stomach gastric ulcer, and chronic appendicitis followed in this clinic, in order of frequency, but these are merely the results in one American hospital I am unable to present the statistics of any large series of gastro-intestinal cases in Britain but it may safely be accepted that cholecystitis is now established here as one of the most common and important intra-abdominal diseases

It is obviously my duty in opening this discussion to give a general survey of the problem before us and not to spend undue time on matters which will be dealt with in greater detail by subsequent speakers

Age, Sex, and Type of Patient

It must nowadays be realized that the female who is fat fair forty and fecund is by no means the only type subject to biliary disorders and to their common sequel of gall stones It is true that cholecystitis is more common in females than in males for reasons which have many times been discussed and which need not detain us now Gall bladder troubles are however, quite common in men and it may be emphasized that cholecystitis occurs in young men and young women and even in children These facts are I think not yet sufficiently and universally realized With the increase of outdoor games and exercise in young people this disease may diminish but there are many mostly living in cities who have sedentary occupations in offices and factories and are prone to dyspepsia and biliary disease In acholuric jaundice a disease generally recognized in youth there is a special tendency to disorders of the biliary tract—both pigment stones and cholecystitis

Aetiology

I have already referred to sedentary occupations as increasing the risk of cholecystitis and indeed the factor of biliary stasis is the only important predisposing cause on which almost everyone will agree It would not be justifiable here to discuss disturbances in the physiology of the biliary tract as a cause of biliary symptoms, since so little is known with absolute certainty Problems concerning the sphincter of Oddi, contraction of the gall bladder and spasm of the main bile ducts are all involved here, and frankly in my view, the time has not yet come to bring questions of disturbances in the physiology of the biliary tract into the realms of ordinary practical medicine We have enough to deal with at present in gall bladder pathology, due to microbic infection of the gall bladder and biliary tract the essential cause of the subject we are discussing—namely cholecystitis Here too, we are faced with the difficulty of reconciling the divergent views of physicians and surgeons for the ultimate benefit of our patients This matter will no doubt be examined fully by Sir Arthur Hurst and Sir David Wilkie and I need only place the general position before you

The points of importance are

1 What are the common microbes which infect the gall bladder and what is their relative frequency?

2 By what route is the gall bladder infected—by passage along the ducts from the intestine or by the blood stream? Do the microbes in fact exist mostly or partly free in the bile or is the infection essentially deep seated in the wall of the gall bladder?

The importance of focal sepsis in teeth tonsils appendix or elsewhere in the aetiology of cholecystitis is an essential part of the problem which I only mention to give a lead to other speakers

Varieties

Cholecystitis with Gall stones—It is obvious that in the past the diagnosis of cholecystitis was seldom made before the common sequel of gall stones had occurred and given rise to obvious signs or symptoms Even nowadays the frequent accidental discovery of gall stones of inflammatory origin at post mortem examinations shows either that a diagnosis was missed or that the symptoms were insufficient to make the patient seek treatment for

* Read in opening a discussion in the Section of Medicine at the Annual Meeting of the British Medical Association Belfast 1937

of the pre-scientific age and [with] verbal symbols This is a hangover from ancient mythologies' Close on the heels of this follows Hyman's criticism of the value of psycho analysis, which he attacks not so much for its mysticism as for its materialism, pointing out among other things that the insistence on the initiate himself being analysed adds a financial burden which effectively reduces competition by restricting the entry into the ranks of approved psycho analysts He believes that the isolation of psycho-analysis from the rest of medicine is due in large part not to the hostility of the large body of physicians but to the reticence and arrogance of the analysts Hard hitting, this!

Dr Sevringhaus, in an interesting introduction to the section on endocrinology, suggests that all endocrine activity should be thought of as serving the functions of communication correlation, and catalysis In developing this theme he shows how this approach will avoid undue emphasis on the importance of any one endocrine activity, and will lead to a new aspect of biology, which will be absorbed into general medicine as biochemistry, nutrition, and other contributions have been

Altogether a helpful and entertaining volume, and no mere series of abstracts

CHEMICAL PHYSIOLOGY

Einführung in die Chemische Physiologie By E. Lehnartz. (Pp 420, 66 figures RM 18, geb, RM 19 60) Berlin J Springer 1937

In writing his Introduction to Chemical Physiology, Professor Lehnartz no doubt had clearly in his mind the class of student for whom the book was intended That point may not be quite so clear to teachers of the subject in this country It contains a great deal too much for the ordinary medical student, and it is obviously not designed for those reading for higher research degrees Probably it is best suited to those students who, being much above the average in scientific attainment, are destined from the beginning for honours in physiology or biochemistry and would therefore be able to take full advantage of a comprehensive volume of this type It may be said at once that the book is typically thorough in the way it covers in each chapter the whole of the ground leading up to concise presentations of the most important of recent work

The arrangement is in four main sections, the first two dealing with fundamental chemistry and physical chemistry respectively, the third embracing vitamins, hormones, and enzymes while the last is concerned with metabolism, interpreting that term in its widest sense The 'chemische anatomie,' to use the author's own term, contains all the essential material, with the exception of any reference to the chemical synthesis of the amino-acids That part devoted to the vitamins, hormones, and enzymes is probably the best in the book, and is a model of compression, for it contains within a reasonably short space the essence of these subjects in connexion with which there has been such a wealth of discovery Some portions placed towards the end of the last section do not quite reach the standard of the rest, rather suggesting that the author himself had less interest in the general chemistry of the body fluids than in the other departments of his field In the final subsection the bracketing together of skin and milk seems a little curious despite the author's explanation, and it would have been better if these had been considered under entirely separate headings

Taking the volume as a whole, the presentation of the subject-matter would have been rendered more palatable to the student by the inclusion of brief explanations of the nature of the actual methods of investigation Illustrations are sparingly used except in the hormone chapters More should have been introduced, not only for their intrinsic value but also because their presence tends to make the background of solid material facts seem less ponderous In general, however, the book has much to commend it, but, for reasons stated at the beginning of the review, its circulation in this country may be somewhat limited

NEUROLOGICAL TUMOURS

Tumors of the Nervous System An Investigation of the Most Recent Advances Proceedings of the Association for Research in Nervous and Mental Disease Vol xvi (Pp 493, 213 illus 64 tables 34s) Baltimore The Williams Wilkins Co London Baillière, Tindall and Cox 1937

The appearance of a new volume of the publications of the Association for Research in Nervous and Mental Disease is always a pleasure, since it is sure to contain something new and much that is interesting The present volume, in its general level and freshness of interest, compares favourably with those that have already appeared As its subtitle indicates, it makes no attempt to cover the whole subject but rather to indicate growing points in research and new diagnostic methods It begins with a description by Drs Canti, Bland, and Dorothy Russell of what they have learnt from the study of cinematographic records of the growth of gliomatous tissue in cultures The chapters on the metabolism of brain tissue (by Dr Wortis) and of brain tumours (by Drs Victor and Abner Wolf) provide fresh information on this new method of research Two advances in clinical diagnostic methods come from the New York Neurological Institute, Dr Elsberg's special olfactory tests for the localization of brain tumours and Dr Cornelius G. Dyke's encephalographic studies of tumours of the corpus callosum Each deals with a refinement of technique which should be of definite value Dr Leo Alexander has made a careful anatomical study of malformations in the region of the foramen of Luschka, indicating their developmental origin and their relationship to tumours and cysts in the ponto cerebellar angle

The other chapters contain less new matter but are valuable reviews by men with unusual experience in the subject with which they have dealt The last two chapters, on tumours of the peripheral nerves and nerve endings, have the special interest, to neurologists at least, of being written by general pathologists who can from a vast experience bring these tumours into line with those which arise from non-nervous tissues Dr Ewing's comments on these articles are a valuable addition to the chapters

The book as a whole is an example of fine team work and a reflection of the high standards of American neurology

Notes on Books

The Doctors Booklet by Walther Klussmann (Leipzig Georg Thieme, RM 4 80), is, as the subtitle indicates, "a collection of words of wisdom for the doctor's leisure moments and a guide to daily practice' The book was originally intended to be the joint work of Dr Erwin Lick and the compiler, who is a dentist at Bad Harzburg, but the former's untimely death prevented the execution of this plan Professor Klare, in the foreword, quotes Goethe's saying that one should every day hear at least one good song, read a good poem, and see one excellent picture In like manner he hopes that this little treasury will be the friend and companion to the doctor and

It must be remembered that in cholecystitis the liver itself is damaged or deranged in function, and a sojourn for treatment at a spa which specializes in hepatic diseases and in the other frequent accompaniments of cholecystitis, such as obesity, may be of great value Disordered function of the liver, so commonly associated with cholecystitis, is claimed by some to be concerned in the aetiology of migraine but I must state that I have never seen migraine in direct association with hepatic disease

Conclusion

In conclusion, my plea is for the more general recognition by doctors in Britain of the great frequency of cholecystitis, of the difficulties that must be faced in making a correct diagnosis of the methods that are of real practical use in diagnosis and treatment, and of the great diagnostic value of the duodenal tube Further, I would express my belief that catarrhal cholecystitis can be cured in its earlier stages by medical treatment, and that in this way we may hope to diminish the incidence of gall stones with their frequent dangers and complications

CHOLECYSTOGRAPHY THE EFFICIENCY OF THE GRAHAM-COLE TEST*

BY

T GARRATT HARDMAN, M D

Radiologist Richmond Hospital Dublin and Royal City of Dublin Hospital

The introduction of this method of examination by Graham and his associates in 1924 was one of the outstanding advances in radiology and it has proved of immense assistance to physicians and surgeons Nevertheless there are many to-day who are inclined to question the accuracy of this method of detecting disease of the gall bladder I believe that such incredulity is most frequently due to a very common human weakness—the disposition to allow one error in diagnosis to make a much more lasting impression on the mind than ninety nine correct diagnoses and so when asked whether the Graham-Cole test is reliable the answer is frequently in the negative

A second reason is a misconception as to how much a Graham Cole test will reveal Some place too great a reliance upon it as an absolute proof of the presence or absence of disease without realizing that there are some unavoidable fallacies No radiologist would attempt to claim infallibility for this method of examination but we do claim that the Graham Cole test carried out with punctilious care as to preparation of the patient administration of the dye and radiographic technique will yield valuable information on the functional ability of the gall bladder to receive and to concentrate bile containing dye This is to some extent a measure of the functional health of the mucous membrane of the gall bladder and the test yields a very high percentage of correct inferences regarding the presence of disease

It must be recognized at once that there are pathological conditions remote from the gall bladder such as duodenal ulcer and chronic appendicitis which will sometimes be responsible for a failure of that organ to show a normal Graham Cole reaction In my opinion such an admission brings home to us the necessity for a complete radiological examination of the gastro-intestinal tract in all cases in which the Graham-Cole test and the clinical history and signs are at variance

In thousands of cases operation has proved that disordered function as shown by a faint shadow or a failure to obtain any shadow, is a result of disease of the gall-bladder and in only a very small percentage are the *x* ray findings due to remote lesions In a large majority of the cases diagnosed as pathological one can only go so far as to say that there is complete dysfunction or impaired function

Conditions affecting the Gall bladder

A differential diagnosis between the conditions which may affect the gall bladder is only possible in a comparatively few cases Stones containing not less than 10 per cent of calcium will be demonstrable on an ordinary film without the introduction of any opaque dye Bilirubin stones are also radiopaque They may be obscured by the dye only appearing when evacuation has occurred Cholesterol stones are translucent If there is no obstruction of the cystic duct, and the gall bladder mucosa is sufficiently healthy to concentrate the dye these stones will be demonstrable as well-defined clear spaces in the opaque dye

Papillomas and adenomas may sometimes be recognized by the marginal defects which they produce Stones do not show such defects, but tend to lie grouped together in the centre of the gall bladder Multiple papillomas may give rise to negative shadows in a dye-filled gall bladder similar to those of cholesterol stones Repeated films taken at intervals would show that the defects remain constant in the case of papillomas whereas stone shadows would alter in relation to one another

The diagnosis of carcinoma of the gall bladder may be made occasionally, and Kirklin of the Mayo Clinic in a paper written in March 1935, refers to a case reported by Taterka in which the tumour produced a large irregular defect along the lateral wall of the gall bladder and in which the entire picture was analogous to that of medullary carcinoma of the stomach as exhibited with the barium meal Such appearances in the gall bladder must be very rare indeed for I believe that in the majority of cases of carcinoma of the gall bladder a well marked defect would be accompanied by such impairment of function of the mucosa that no shadow would be obtained by the Graham Cole test

I find it difficult to express a definite opinion upon Professor McNee's criticism that "x rays generally do not yield information of positive diagnostic importance in the early cases of catarrhal cholecystitis I do not know at what stage in the course of the disease the function of the mucosa would be sufficiently affected to present positive x ray signs or the duration of time which might elapse before such an effect was produced I think that most of the cases sent for examination are those which have been suffering from recurrent attacks of cholecystitis but I believe that a certain number of early catarrhal cases associated with duodenitis will show delay in the emptying time of the gall bladder Some workers have had experience and positive proof of such cases but Kirklin states that he does not attach much importance to delay in filling or emptying

It is impossible to go fully into the details of technique here Suffice it to say that the correct preparation of the patient strict directions as to the avoidance of all food until permitted and a careful radiographic technique are essentials for reliable results

SATURDAY OCTOBER 16 1937

BROWN BREAD VERSUS WHITE

At a combined meeting of the Sections of Nutrition and Obstetrics and Gynaecology at Belfast this summer Sir Robert McCarrison drew attention to the importance of the provision of bread made from lightly milled cereals instead of the highly milled white bread which accounts for from 80 to 94 per cent of the bread consumed in this country Under present conditions in the baking trade bread may be divided into three main classes (1) white bread, from which both the bran and the germ of the wheat have been removed, (2) ordinary brown bread, which contains bran but very little germ, (3) "germ," whole-meal, or health breads, in which wheat germ with or without bran is incorporated The last may be made from lightly milled flour, or from white flour to which has been added germ—sometimes after being stabilized to prevent rancidity For nearly seventy years "white" flour in England has signified flour from which both germ and bran have been removed by "bolting" The removal of the germ deprives the flour of a number of important food substances, and for many years past authorities have debated, sometimes with a good deal of acerbity, whether the loss is of any serious importance in practical nutrition In 1929 Hartwell and Mottram[1] argued from the results of rat-feeding experiments that propaganda urging the use of brown bread by the working classes was uncalled for They also stated that it could be taken as certain that brown —that is, whole-meal—bread contains more protein of good biological value, more vitamin B_1, and more minerals, but held that in the mixed diet consumed even by the poorer classes deficiencies of white bread were adequately made up from other sources in the diet

Of the physiologically important constituents which are removed with the germ, vitamin B—and particularly the component B_1—is one requiring careful attention, for it seems probable that the protein and mineral deficiencies of white bread are far more likely to be made good by the other articles of the diet, even in the diets of the poor, than is this particular defect The use of the bradycardia test by Harris, and independently by Baker, Wright, and Drummond,[2] in place of the growth test, leaves no doubt as to the superiority of brown bread over white as a source of vitamin B_1 Baker, Wright, and Drummond accept the estimate of Cowgill, which they have themselves verified, that a 10 stone man consuming 3,000 calories daily needs 300 international units (I U) of vitamin B_1 to protect him from beri-beri This is the minimum requirement It is reasonable to suppose that the full physiological requirement is higher than this, and they regard 500 I U as a moderate estimate thereof They direct attention to the well-established facts that increased body weight, increased consumption of food, and pregnancy call for an increased intake of vitamin B_1 and that a positive correlation exists between the total carbohydrate content of the diet and the amount of B_1 necessary The requirements of the poorer people who habitually eat carbohydrate-rich diets are therefore greater than those of more fortunate individuals Morgan and Frederick, in 1935, estimated that whole-wheat bread (fresh) contained 98 to 130 I U of vitamin B_1 per 100 grammes of bread (that is, 1 to 1 3 per gramme), and that white bread (fresh) contained 0 3 unit per gramme Baker, Wright, and Drummond have arrived at estimates of a like order, but they find that there is considerable variation in the vitamin B_1 content of bread and give as average values 1 15 units and 0 15 unit per gramme for whole meal and white bread respectively Sometimes it is claimed that the yeast employed in baking is valuable in making good the deficiency of the flour in B_1 Ordinarily this is not so Bakers' yeasts vary considerably in vitamin B_1 content, but the figure 4 I U per gramme is a reasonable one to assume An addition of 30 to 60 oz of such material to a 280 lb sack of flour does little to improve the nutritive value of the loaf "Actually 0 66 lb of flour with a B_1 content of 0 15 I U per gramme together with this proportion of yeast will yield a 1-lb loaf with a value of 0 12 I U per gramme"

A striking fall in the consumption of bread and flour has, according to Lloyd and Orr, occurred during the past hundred years The consumption of flour in 1840 corresponded to about 21 3 oz of bread per day, in 1934 it was only 11 6 Regarding the former as a whole-meal product with a vitamin B_1 value of 26 units per oz and the white flour as having about 5 units per oz, Baker, Wright, and Drummond calculate that the change in character and intake of bread alone has caused a reduction in available vitamin B_1 of from 550 units to less than 60 They give some interesting

MAGNESIUM TRISILICATE*

BY

N MUTCH, M.A., M.D., F.R.C.P.

Physician to Guy's Hospital and Lecturer in Pharmacology to London University

Since the publication of my original papers (Mutch 1936, 1936a, 1936b) on this substance last year a number of alleged trisilicates of magnesium have been placed on the market and a certain amount of analytical work on siliceous magnesian precipitates has been published by N. Glass (1936). The results of the manufacturers' efforts have on the whole been disappointing. Many of the products offered for sale are either grossly contaminated or incorrectly described, being of compositions which in no way approximate to that demanded by the theoretical formula, and Glass's studies are deprived of their scientific interest by his use of inaccurate methods of analysis (Rugg, 1936). If any ultimate judgement is to be made of the clinical value of a new therapeutic substance it is essential that the true substance itself shall be employed uniformly.

Identity

Much advance has been made in recent years in our knowledge of the molecular structure of the silicates. Chemical methods failed to distinguish adequately between different silicates bearing a common group constitutional formula. Physical analysis, particularly the diffraction radiograph, has supplied the need and is steadily evolving order out of chaos. For example, three hydrated silicates of aluminium possess the same formula $H_4Al_2Si_2O_9$. Their diffraction radiographs, however, are dissimilar and provide a basis for the classification of substances of this chemical composition into three distinct groups—dickite, kaolinite, and nacrite (Ross and Kerr, 1931). Hydrated trisilicate of magnesium occurs in two forms (Longchambon, 1935): sepiolite No. 1 or meerschaum, and sepiolite No. 2. The composition of each is represented by the formula $H_4Mg_2Si_3O_{10}$, often written as $2MgO.3SiO_2.2H_2O$. Structurally they are distinct, and each gives its own characteristic diffraction radiograph. Medicinal magnesium trisilicate can therefore be defined as a laboratory-prepared substance with a composition represented by the formula $H_4Mg_2Si_3O_{10}$, and yielding a pure diffraction radiograph of sepiolite No. 1 or of sepiolite No. 2. The artificial magnesium trisilicate which I originally described, and have continued to use, is such a substance. Radiographically it is identical with sepiolite No. 1. It is not, as is erroneously implied in Martindale's *Extra Pharmacopoeia* (1936), to be confused with precipitated magnesium silicate. Such precipitates are vague and variable siliceous gels containing a certain amount of magnesium. Synthetic magnesium trisilicate is a chemical entity built up from its component parts which, after association in colloidal form, are subjected to a process of maturation at 15° C.

I am indebted to Dr. D. F. Claringbull and Dr. M. H. Hey of the Mineral Department of the British Museum (Natural History) for the radiological identification of the product. The diffraction radiograph exhibited well-defined first order lines at 1·32, 1·54, 1·72, 2·62, 3·41, and 4·46 Angstrom units, whilst the line expected at 11·35 was outside the limits of the radiograph. The radiograph agrees accurately with the most recently published data (Migeon, 1935) and with radiographs of natural sepiolite No. 1 taken at the same time for purposes of comparison. The intrinsic particles were shown to be of finely colloidal dimensions with a crystalline basis. In size they were much smaller than those of kaolinite or of the most refined varieties of medicinal kaolin available.

Analytical Survey

Chemical analyses of a number of the products put forward by various manufacturers as magnesium trisilicate are given in Table I.

TABLE I.—*Analysis of Various Brands offered as Magnesium Trisilicate*

METHODS

The analytical methods described by J. W. Mellor (1913) were carried out with meticulous care. Refinements were introduced to ensure full precipitation of the silica (Mellor, 1913; Scott, 1925; Groves, 1936) and the recovery of all traces of iron and alumina (Mellor, 1913a) carried down with it. The moiety of magnesium (Mellor, 1913b) which incorporates itself with the calcium precipitate was also dealt with by the standard approved technique.

* Read in the Section of Pharmacology and Therapeutics in [illegible] Anæsthetics at the Annual Meeting of the British Medical Association, Belfast, 1937.

pharmaco-dynamic properties of certain drugs used as substitutes for morphine—namely, eucodal, dicodide, dilaudide, and acedicone—have also been under discussion, and the Secretariat of the League is preparing a memorandum embodying such information as has been collected

The representative of the United States reported on work carried out in his country, with the assistance of grants from the Rockefeller Foundation to the National Research Council, on the study of drug addiction During the last year, he said, three new substances had been patented, consisting of new ethers of morphine and its dihydrogenated derivative, dihydromorphine, and the new patents had been presented to the Secretary of the United States Treasury so that he might exercise general supervision over experimental studies with these substances It is hoped that they may be useful in substituting non-habit-forming drugs for the habit-forming derivatives of opium The same country has also placed at the disposal of the Advisory Committee a clinical study on the use of bromsalizol or monobromsaligenin in the treatment of pains accompanying chronic arthritis Another matter which has occupied attention is the preparation of standard rules for the control of pharmacies, and a memorandum has also been prepared showing that abuse and falsification of medical prescriptions occur in many countries The representative of Mexico stated that in his country the issue to medical, dental, and veterinary practitioners of special books of forms for the writing of prescriptions, printed on special paper and consecutively numbered, had proved useful, and this suggestion is to be further examined Finally, a subcommittee on the subject of Indian hemp has held three sessions The subcommittee finds that the data as yet before it in regard to the medical use of derivatives of *Cannabis indica* are still very limited The reports so far received express the opinion that the medical value of these derivatives is doubtful, that their use is decreasing, and that at least one country contemplates dropping them from its pharmacopoeia (No preparation of Indian hemp appears in the *British Pharmacopoeia* of 1932) An examination of 125,000 prescriptions in the United States showed that only 4 or 5 in each 10,000 called for derivatives of cannabis Information in regard to insanity resulting from the use of cannabis and to the relation between cannabis addiction and crime has been presented, and the experts have been asked to collect all information available on these subjects throughout the world

So far as the United Kingdom is concerned, the report for 1936 of H M Government to the League of Nations on traffic in opium and other dangerous drugs is a reassuring one If all the Governments which are parties to the Conventions of 1912, 1925, and 1931 could furnish equally complete and satisfactory returns the problem of the international traffic in narcotics would be nearing solution Inasmuch as raw opium, the coca plant, and Indian hemp are not produced in this country, administration of the International Conventions is mostly concerned with the manufacture, trade, and distribution of the drugs derived from imported raw materials The Pharmacy and Poisons Act of 1933 and the rules made under it came into full operation on May 1, 1936, but these did not materially modify the arrangements in regard to the sale and supply of dangerous drugs It is reaffirmed that addiction to narcotic drugs is not prevalent in the United Kingdom, and, indeed, that the number of addicts known to the central office is approximately 616—313 men and 303 women, 137 members of the medical profession are found in the list Morphine is the drug mostly resorted to, less frequently heroin or cocaine As regards international trade the system of import certificates and export authorizations continues to work well, there are no free ports or free zones in the United Kingdom and the deposit of dangerous drugs in bonded warehouses is not permitted Illicit traffic, which is still rife in the Far East and the Levant, is almost unknown here and is practically confined to seamen, mainly Orientals, the amount of opium seized by the Customs authorities last year was 9 kilogrammes

Only two firms in Great Britain are authorized to manufacture morphine, heroin, codeine, and dionine, and only one to manufacture cocaine Vigilant inspection, without warning, is carried out in the case of factories and of licensed dealers, and supervision is exercised over persons authorized to possess and use dangerous drugs Where such person is convicted of irregularities the Secretary of State is empowered to cancel the authorization to possess, supply, or prescribe the drugs Last year this power was exercised in ten cases, six being medical practitioners During the year 248,850 lb of raw opium were imported and 119 227 lb exported The chief recipients of the latter were Germany and the United States The exports of morphine and heroin from the United Kingdom show a reduction on the figures of previous years Prepared opium, which is still exported from India to certain Crown Colonies, is occasionally brought in by Chinese for smoking Its possession and use are totally prohibited here, and when seized it is confiscated and destroyed There were sixty prosecutions under the Dangerous Drugs Act in 1936, fifty-four resulted in conviction, forty-five were punished by fine, and nine by imprisonment

sepiolite and acids At body temperature and with N/20 hydrochloric acid a substantial secondary neutralization continues for more than an hour after the quick initial interaction has occurred (Mutch, 1936, 1936a 1936b) Secondly the non poisonous nature of the sepiolite which enables adequate doses to be given to compensate for the continuous loss through the pylorus Animal experiments have failed to reveal any deleterious cumulative effect (Mutch 1936a) and clinically it has been found that artificial sepiolite does not induce alkalosis

Alkalosis—The hourly administration of milk equivalent in all to about 3½ pints of 0 3 per cent hydrochloric *acid daily does not abolish the acidity of the gastric* juice Chemically this volume of milk is equivalent to about 345 grains of dried sodium bicarbonate The danger of clinical alkalosis probably begins when the daily intake of sodium bicarbonate exceeds 300 grains Much larger quantities of sepiolite No 1 can, however, be given with impunity Alkalosis is caused by simple absorption of a soluble alkali when the dose administered exceeds the demands of the acid actually in the stomach at the time It is caused also in part by the loss of that portion of the gastric acid which is neutralized by the medicament unless (1) the basic substance administered is eventually metabolized—for example, ammonium or protein—or (2) the base is reprecipitated in insoluble form in the small intestine

In the case of sepiolite soluble magnesium chloride is produced as the gastric juice is neutralized In an alkaline medium the base magnesium, is readily reprecipitated as magnesium hydroxide and so prevented from interfering with the internal balance between bases and acids Sepiolite itself is neutral and insoluble so that the unutilized excess cannot add to the body s alkali reserves

The validity of these deductions has been borne out in practice Magnesium trisilicate has been used extensively without provoking symptoms of alkalosis (A F Hurst 1936 T Hunt 1937, T L Hardy 1937) Biochemical

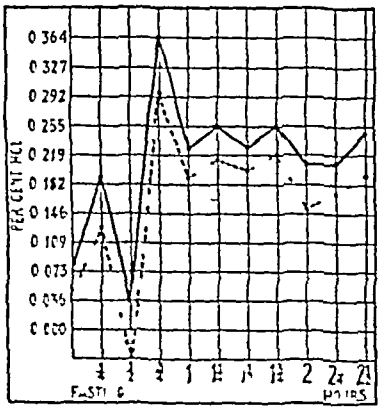

Fig 1—Fractional Test meal Curve of a Case serving as a Basis for Biochemical Observations on Possible Alkalosis (Note the hyperchlorhydria)

analyses of the blood and urine confirm these findings I am indebted to Dr J H Ryffel for the following analyses carried out on a patient recently under my care in Guy s Hospital for duodenal ulcer The man aged 5 had suffered from bouts of epigastric pain in late relation to meals since 1929 Dr Lindsay Lockes radiograph s showed marked deformity of the duodenal bulb The faeces contained occult blood and gave a spectrum of haematoporphyrin The fractional test meal curve was that of hyperchlorhydria with slight delay (Fig 1) The plasma bicarbonate was estimated and various urinary analyses made as recorded in Table II It will be seen that in spite of the taking of 3½ ounces of true artificial sepiolite daily for three weeks his urine remained acid there was no fall in the ammonia N/total N ratio and no

TABLE II—*Alkali Reserve with Large Doses of Sepiolite* (*Note No alkalosis*)

sensible increase in the plasma bicarbonate There was thus no chemical evidence of established or commencing alkalosis

Laxative Action—Artificial sepiolite sometimes produces a laxative effect The action is not apparent in laboratory animals and is usually inappreciable in man On occasions however it proves troublesome Magnesium chloride released in the stomach operates osmotically in the bowel as a saline aperient The varying response of *different individuals can be attributed to several factors* Personal susceptibility doubtless plays a part The amount of magnesium chloride produced depends not only on the dose of silicate given but on the acidity and volume of the gastric contents and the rate of outflow through the pylorus The proportion remaining in solution is determined by the extent to which precipitation of insoluble magnesium hydroxide and carbonate is effected by the alkaline pancreatic juice *The final amount available in* solution in the lower part of the bowel is again influenced by the reaction of the ileum and colon If their contents are acid hydroxide and carbonate will pass once more into solution and act osmotically as an evacuant There is clearly the fullest opportunity for the display of wide individual variations in response The effect is easily controlled when necessary by the simultaneous administration of a suitable amount of some constipating ad so bent such as kaolin or charcoal or of a constipating antacid such is chalk

Dosage

HYPERCHLORHYDRIA AND CHRONIC PEPTIC ULCERATION

When sepiolite is added to a chemically equivalent *amount of dilute hydrochloric acid the interaction no* only takes place relatively slowly but is incomplete For example with N 20 HCl the mixture remains strongly

Generally speaking all cases not falling under Stage II or IV will be placed under Stage III

Stage IV (*a*) Cases with massive infiltration of both parametria extending to the pelvic walls (*b*) Carcinoma involving the bladder or rectum. (*c*) The whole vagina infiltrated (rigid vaginal passage) or one vaginal wall infiltrated along its whole length with fixation of the primary growth (*d*) Remote metastases

The information from the various centres is given in tabular form which admirably suited for the information of those writing or working upon this particular subject, will necessarily not appeal to non expert readers The general editor of the report is Dr J Heyman, Radiumhemmet, Stockholm who is also in charge of all correspondence with the various collaborators

THE RED BLOOD PICTURE IN HEALTHY INFANTS

In the many recent studies of the blood picture of infants and children the word "normal" is naturally frequently used This term can designate the average of a large number of individuals, or in the sense of being contrary to pathological states it can be used to qualify the blood picture of fully healthy individuals Dr Nils Faxen has published some investigations[1] in which he approached the question of the normal blood count in infancy from the point of view of the findings in strictly healthy infants In a summary of the previous literature he refers to the discrepancies between the results obtained by different workers, and points out that in the classical investigations of Dr Helen Mackay even the breast-fed infants had a lower haemoglobin level than bottle-fed children who had been treated with iron suggesting that the results for the breast-fed group cannot be strictly considered as normal in the sense of being in no way pathological Faxén's material was very strictly selected from among the newborn infants at the Gothenburg Maternity Hospital and from children's care centres in the city They had to fulfil certain conditions as regards maturity at birth, subsequent diet and general health The estimates included determination of the haemoglobin, the red cell count, reticulocytes and diameter of the red blood corpuscles A careful statistical analysis of the figures was made, and, although differences in the arrangement of material by other workers makes direct comparison difficult, it seems obvious that the values obtained from 3 months of age for haemoglobin are higher throughout, while the haemoglobin percentage for the newborn babies in the Swedish series corresponds closely to that obtained by American and English investigators According to Faxen's work the haemoglobin figure for the first week of life is about 22 7 grammes per 100 c cm of blood During the following three months the haemoglobin level falls to a minimum of 12 7 grammes at 3 months of age and then there is a moderate rise to 13 7 grammes at 5 months of age With regard to the red blood corpuscles the following were Faxén's results 'In the first week of life the number is moderately high about 5 5 millions, decreases to a minimum 3 9 millions at 2 and 3 months of age afterwards rising again to about 4 5 millions, at which value the number of red corpuscles remains for the rest of the first year of life" Among other interesting points such matters as seasonal variations and racial considerations are discussed The question whether it is justifiable to characterize "normal" children as anaemic is one which requires careful thought

DR. SAMUEL GEE AND HIS FRIENDS

Sir Humphry Rolleston contributes a pleasant little article on Dr Samuel Jones Gee and his friends to the anniversary volume in honour of Dr Joseph Hersey Pratt It now appears in the *Annals of Internal Medicine* vol xi No 2 August, 1937, and is thus accessible to a larger circle of readers Dr Gee (1839–1911) was a physician to St Bartholomew's Hospital He was recognized as a great clinical teacher, learned in the sense that the eighteenth century physicians were learned, sparing of his words, a concise writer, but no lover of society Even in his lifetime he became somewhat mythical What his pupils did not know they invented, and innumerable stories grew up around him, sometimes with a basis of truth but mostly as a result of imagination He married the daughter of a Quaker accountant had two daughters and died suddenly of heart disease while he was on a summer holiday in the Lakes Interwoven with the story of his life Sir Humphry tells of contemporary happenings at St Bartholomew's Hospital, which make good reading for many who are still alive and can testify to their truth from their own memories He adds, too a likeness of Dr Samuel Gee which is a fair portrait but lacks the characteristic expression familiar to his students

TUMOURS OF BLOOD VESSEL SHEATHS

Malignant tumours of the blood vessels are not common One of the first accounts was given by Carl Regnault in 1887, who termed them Gefasscheiden tumoren Five cases of angio endotheliomatous tumours arising in connexion with the sheath of large blood vessels have recently been reported by Lenormant Moulonguet, D'Allaines and Menegaux[1] These tumours were found in adults between 40 and 60 years of age Because of their rarity diagnosis is not at once apparent, and they are liable to be regarded in the first place as lipomas sarcomas, or myxomas *There are two main clinical varieties* In the first, which gives no evidence of its vascular association, the tumour is deep circumscribed, and sometimes bosselated It is firm in consistence and slowly growing, and occurs in the line of a large artery such as the femoral axillary posterior tibial, or carotid In the second variety the signs and symptoms resemble those produced by an arterial aneurysm, but there is no bruit, nor is the size of the tumour varied by compressing the main vessel In none of the cases have related lymphatic glands been involved, but the tumours are malignant amputation did not save the patient in the first of the cases recorded death supervening two years later A necropsy was not obtained The tumour

HYPOCHLORHYDRIC GASTRITIS

Within certain limits of dosage advantage can be taken of the general adsorbent action of sepiolite in the treatment of gastritis of the subacid type It has just been shown (Figs 4 and 5) that at low degrees of acidity the neutralizing effect of sepiolite is greatly enfeebled It can be demonstrated also that the reaction as measured by the *p*H value remains on the acid side of the neutral point on a properly balanced system The final *p*H attained by mixtures of acid of various concentrations with equivalent weights of sepiolite was N/10 < 2 8, N/20 3 3 N/50 6 0, N/200 6 3 (Readjusted for dilution the value for N/20 HCl becomes 5 1 instead of 3 3)

Fig 6 gives daily observations on N/200 HCl mixed with its equivalent of sepiolite By the end of twenty four hours the *p*H was only 4 7, and the general trend of the curve indicates that several weeks would have elapsed before neutrality could have been approached Experimenting with the effect of an excess of sepiolite on the ultimate acidity it was found that N/200 HCl mixed with 23 per cent excess of sepiolite still remained slightly acid (*p*H 6 7) at the end of a week Pepsin remains active at the neutral point and is not destroyed until an alkalinity of *p*H 7 25 is reached Such pepsin therefore as remains free, together with the portion adsorbed by the colloidal silica released from the sepiolite would in the above circumstances still be available for protein digestion

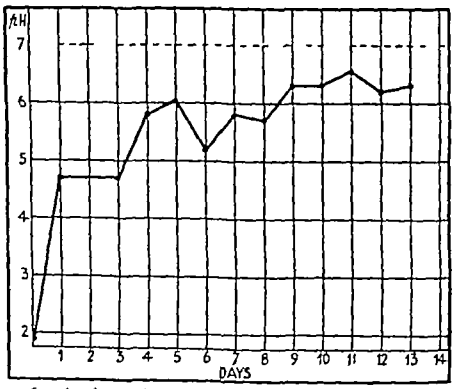

FIG 6—Acidity of Mixture containing Equivalent Weights of Artificial Sepiolite (Magsorbent) and N/200 HCl

As a general approximation the total daily dose which could probably be taken by patients with hypochlorhydria without abolishing peptic digestion would be considerably greater than the chemical equivalent of two litres of gastric juice at the maximum free HCl strength of the fractional test meal + 50 per cent for pyloric loss + 25 per cent for permissible excess of sepiolite over acid—for example maximum free HCl = 0 05 per cent (approximately N/70) The daily dose of sepiolite on these assumptions would be 2½ grammes, or 39 grains of the substance as prescribed (25 per cent moisture)—that is a 7 grain tablet five or six times a day

Summary

1 Medicinal magnesium trisilicate is defined as a "compound represented by the formula $H_4Mg\ Si_3O_{10}$ and giving the pure diffraction radiograph of the natural mineral sepiolite No 1 The ratio MgO SiO = 1 2 24 (gravimetric)

2 It is shown that many of the marketed brands fail entirely to conform to these basal requirements

3 The following therapeutic applications are discussed (*a*) the continuous control of gastric acidity in hyperacid states (*b*) the production of gastric anacidity without systemic alkalosis, (*c*) the utilization of the general adsorbent properties of the silicate in hypo acid conditions

4 It is demonstrated that (*a*) Artificial sepiolite No 1 does not cause alkalosis (*b*) The extent and speed of interaction with acids diminish rapidly at hypochlorhydric strengths Within certain limits of dosage the neutralizing effect is automatically adjusted to the demands of the gastric juice (*c*) Within a certain range a useful amount of the silicate can be given in hypochlorhydric states without its neutralizing the gastric contents to such an extent as to destroy peptic activity

5 An explanation of the variability of its mildly laxative action is put forward

6 Schemes of dosage appropriate to hyperchlorhydric and hypochlorhydric conditions respectively are discussed

The French Society of Dermatology and Syphilology announces that an anonymous donor has offered a prize of 5 000 francs for the best work on dermatology or syphilology to be awarded every two years The first award will be in May, 1939 the subject being the processes of sensitization and immunization in the epidermomycoses Both French and foreign authors whose work has been written in French or translated into that language are eligible for the prize The articles should be sent to the general secretary Dr P Fernet, 11, Rue de Sontay Paris, 16e, before March 30, 1938

ANAESTHESIA IN GENERAL PRACTICE

This is one of a series of articles, contributed by invitation

POST-OPERATIVE TREATMENT

BY

R MACHRAY, M B

A variety of conditions needing treatment arise after an operation Some of these result more or less normally from the disturbance produced by the operation and the anaesthetic, while others are due to error in technique or to idiosyncrasy on the part of the patient An important factor that is often overlooked is the necessity for gentle handling of an anaesthetized patient while he is being returned to bed A profound change may follow the sudden alteration in position of a shocked patient, as may be demonstrated if after an operation in the Trendelenburg position the table is suddenly restored to the horizontal Sufficient assistance should therefore be available for all necessary movements to be carried out as gently as possible

Pulmonary Complications

When in bed the patient s head and shoulders should be raised on pillows, if there is no contraindication to this, as soon as he is sufficiently conscious He should be encouraged to move himself as much as possible and to expand his lungs fully at frequent intervals If unconsciousness is prolonged this latter manœuvre can be brought about by the administration at half-hourly intervals of carbon dioxide in quantities just sufficient visibly to stimulate respiration without it being at all laboured These measures will do much to combat the incidence of pulmonary complications Should any such complications supervene—bronchitis, bronchopneumonia, pulmonary collapse—then suitable treatment must be given In cases of pulmonary collapse from blocking of a bronchiole carbon dioxide inhalation is probably harmful, as it causes the plug to be sucked further in A stimulant mixture should be used in the hope that the plug may be dislodged by coughing Bronchoscopic suction may be successful in some cases In bronchitis and bronchopneumonia expectoration is often interfered with by pain in the wound Here small doses of morphine repeated four-hourly may, paradoxically, render the coughing easier by making it less painful The administration of iodides and stramonium will help to loosen the secretion Ammonium carbonate, 4 grains in milk, is of value, but as it is a powerful stimulant of secretion it should not be given when this is profuse, as in acute ether bronchitis Hot inhalations may prove soothing and beneficial, especially when there is a tenacious plug of mucus in the trachea that moves up and down with respiration If there is any dyspnoea or cyanosis oxygen should be given through a nasal catheter or, better still, the patient should be placed in an oxygen tent

These conditions, however, are best avoided by prophylaxis, which should take into account the three groups into which the causative factors fall First the patient s resistance should be at the maximum and sources of focal sepsis removed Secondly, the position of the patient during the operation should interfere as little as possible with respiration, the operation should be conducted gently and speedily body temperature should be maintained and tight bandaging around the chest be avoided Thirdly the anaesthetic, including pre- and post-operative sedatives, should be carefully selected and controlled, and all risk of gross aspiration of blood and vomit prevented during and after the operation

Pain

Post operative pain varies widely, not only with different operations but with the same operation in different patients, and it is therefore impossible to lay down any routine treatment Two principles must be kept in mind first the dosage must be adequate to provide relief, and, secondly, overdosage must be avoided as leading to respiratory depression and hindering recovery from shock Occasionally these two principles will prove incompatible, but in such cases it should be suspected that the drug employed is not the most suitable, and trial should be made with other drugs or different preparations of the same drug Sometimes lack of success with full doses of a potent narcotic will be followed by complete relief of pain with what is generally speaking a much milder drug Alternatively, tincture of opium may prove more successful than injections of morphine

It is a good plan to prolong the analgesic effect of the anaesthetic by giving rectally 30 to 60 grains of potassium bromide in saline as soon as the patient returns to bed This is especially valuable where recovery would otherwise be very quick, and greatly reduces the amount of restlessness, which is often so troublesome Aspirin, 15 to 25 grains, is frequently given with the bromide, but there is evidence that it is not absorbed through the rectal mucous membrane It is better to withhold morphine until there are definite signs that it will be needed rather than to order its routine administration while the patient is still fairly deeply anaesthetized But after a varying length of time the necessity for some more potent drug is evident When these signs appear—restlessness and pain—morphine should be given promptly, so that it will have its effect before full consciousness is attained The dose needed varies with the patient and the degree of pain, but usually 1/6 grain for adults is sufficient and this dose may be repeated four-hourly When this is necessary for any length of time the possibility of starting an addiction must be guarded against, and the morphine withheld unless there is very real need for it and some other drug substituted Heroin is sometimes given instead of morphine, but its analgesic action does not appear to be superior, while the amount of respiratory depression is occasionally considerable Its use is therefore better avoided except in difficult cases where morphine produces little relief In such cases heroin may be more effective In many operations the pain can frequently be relieved by less potent drugs The pain after orthopaedic operations, for instance, often yields to aspirin 10 to 20 grains, phenacetin 2½ to 5 grains This can, of course, only be used in cases where it is likely to be retained

Local treatment should not be overlooked For example, the application of heat or cold and the immobilization of a limb in a comfortable position may produce more relief than the administration of an analgesic drug

Vomiting

When vomiting occurs it varies in amount from a little retching to copious and persistent vomiting lasting several days and possibly ending fatally It may follow any

the gland undergoes a fleshy enlargement If the infection is heavy or the resistance of the host poor the gland will undergo caseation in its central part and the surrounding parenchymatous tissues will be found infiltrated with oedema This periadenitis is probably due to the more dilute toxins of the bacillus that have spread out from the main centre of infection, the caseous area Neighbouring glands in the chain are invaded, and soon many of these swollen glands will be found matted together by periadenitis The caseous pus may rupture the gland capsule and burrow to the surface penetrating the deep fascia of the neck and becoming subcutaneous A collar stud abscess is then formed The skin over the swelling is thus fixed either by the periadenitis or by the abscess, which if left alone will burst This devitalized skin can at any time act as a path for secondary infecting organisms, and should such an infection occur either through the skin or by way of a sinus the cold abscess becomes an acute infective abscess

In favourable cases of tuberculous lymphadenitis the gland does not proceed beyond the stage of fleshy enlargement, and with or without treatment shrinks to normal It should be mentioned, however, that there is a rarer type of case in which many glands are enlarged in a way that superficially resembles Hodgkin's disease These glands are multiple, discrete, mobile, and do not caseate They do not respond well to constitutional treatment and they recur after operative removal An example of this type has been quoted below

At any stage of the disease resolution may start as the natural resistance of the patient becomes effective Periadenitis the signal of an active and progressive infection by the tubercle bacillus, first disappears and the glands become more discrete, mobile and firm to the touch The caseous pus if it has not been discharged, dries up and in time is calcified The remaining small, hard calcified gland may feed a sinus through which the whole gland can be extruded as a foreign body thus completing the natural cure

The above conception of the pathology of tuberculous lymphadenitis is the basis of the following classification and is the guide to treatment The diseased glands are divided into three groups

Group 1 Enlarged Glands with Periadenitis—The glands may or may not contain pus or caseous material and the periadenitis exists with or without an abscess or sinus The periadenitis is due to tuberculous infection in an active stage, and there may be superadded a septic infection

Group 2 Enlarged Glands without Periadenitis—These are cases in which either the infection has not been virulent or the periadenitis has subsided naturally or as a result of treatment These glands may or may not have broken down

Group 3 Cases of Residual Infection Following Natural or Artificial Attempts at Cure—The glands in this group are usually small and hard, and may lie at the bottom of the sinus Residual glands of this nature are found when complete resolution has not followed conservative treatment and in cases after operative removal without constitutional treatment

The following table shows the cases in this series in the groups in which they were placed on admission

Group	No of Cases	Per cent
1	80	67
2	25	21
3	14	11

Principles of Treatment

The basis of the classification into three groups is increasing quiescence, the aim of treatment is to carry the case from Group 1 through Group 2 into the soundly healed state

The Group 1 cases are treated by constitutional measures and minor operative procedures, and by this means the periadenitis will be abolished and tissue breakdown will cease The glands may then be considered to have reached the stage of those included in Group 2 If reasonably rapid progress is being maintained under constitutional treatment by Group 2 cases this form of treatment should be continued If there is lack of progress or if the patient's circumstances demand his return to work in the least possible time, radical operative removal of glands in this stage is to be performed It will thus be seen that it is the more persistent and difficult cases which require radical operation If the case is in Group 3 with a residual gland, operative removal is usually indicated A persistent sinus which is not caused by a residual gland usually heals by constitutional measures Finally operation may be employed for cosmetic reasons when the disease itself is quiescent

Details of Treatment

Tuberculous lymphadenitis may be regarded as a local tuberculous lesion in a patient whose resistance to the disease is insufficient Constitutional treatment, therefore, is of paramount importance to prevent progress or recrudescence of the disease The chief factors in constitutional treatment are rest, open air, a liberal balanced diet with adequate vitamin supply and heliotherapy

With regard to rest, the patient should be restrained from all activity, but in our experience rest in bed for the whole day is not necessary unless the disease is very active Fixation of the head and neck in sandbags or plaster has only rarely been used in this series Natural sunlight and artificial light treatment have been found to be of value, both generally to improve the patient's resistance to tuberculosis and locally to ulcers of the neck following the breaking down of tuberculous glands One of us (M C W) has seen cases of tuberculous lymphadenitis treated by Dr T Gordon Pugh at Carshalton with radium applications used as an adjuvant to constitutional measures with good results Of the use of x rays in treatment we have no experience

Reference has been made to the importance of tonsillar and pharyngeal sepsis in the pathology of tuberculous glands of the neck The practice in cases showing signs of tonsillar disease has therefore been to perform tonsillectomy as soon as the patient is acclimatized and the general condition is sufficiently good to render the operation a matter of incident only Following this treatment there is improvement in the general condition of the patient and in the rate of subsidence of the glands It should be noted that the presence of retropharyngeal glands may complicate tonsillectomy, and in such cases we prefer to wait until a considerable amount of resolution has occurred in the gland so placed before advising the operation

The treatment of a tuberculous abscess arising from a gland depends on whether superadded secondary infection has occurred or not If there is secondary infection the pus should be evacuated by incision and free drainage should be established If there is no secondary infection an attempt should be made to treat the abscess by aspiration It should be remembered, however, that as a

days It should not, however, be put off too long, as the bladder will then become overdistended The extent of the bladder dullness should be watched, and if it extends more than a short distance above the symphysis a catheter should be passed Ten grains of hexamine or half an ounce of glycerin left in the bladder will encourage subsequent micturition

TYPHOID FEVER IN THE BASQUE REFUGEE CAMP

BY

RICHARD TAYLOR, M B, B S,

Senior Medical Officer of the Camp

A unique event occurred in May of this year when large numbers of children arrived in England from the scene of the Spanish civil war Their embarkation from the port of Bilbao and subsequent arrival by the s.s *Habana* at Southampton have been described already in medical journals

By May 24 over 4,000 children between the ages of 5 and 14 had arrived at North Stoneham Camp They had lived for some months in Bilbao and surrounding villages, many of them in bomb-proof shelters and cellars, with contaminated water to drink and very little food True to its reputation the Bay of Biscay had been rough, and most of the children had been sea sick They were accompanied by 280 Spanish women teachers and fifteen Catholic priests, only four of whom could speak English The main camp had been hurriedly organized for the reception of 2,000, and the English volunteers had only forty-eight hours notice that 4,000 were on the way Including the English staff it was estimated that 5,000 human beings were crowded into one large field The care of such a large number of alimentary tracts under these conditions constituted an emergency public health problem of the highest importance

On May 26, two days after arrival, two cases of unexplained pyrexia admitted to hospital in Southampton direct from the *Habana* were diagnosed as enteric fever It was therefore necessary to take all precautions to prevent the spread of the disease

Camp Organization

The medical personnel consisted of five resident doctors, a matron, six trained nurses, and about twenty V A.D s The following units were organized, with telephonic communication, a medical officer being in charge of each

1 *Headquarters marquee*

2 *Casualty marquee* to which was attached an Army hospital tent with twelve beds This unit served as a camp out-patients' department

3 *Isolation camp* constructed a hundred yards away from the main camp, provided with a three foot fence and patrolled It was divided into two parts, one half consisted of a second Army hospital marquee for observation cases and the other half of bell tents for typhoid contacts It was an independent unit with its own cookhouse latrines, and shower baths

4 *Moorhill* an old country house situated four miles away, converted for use as a temporary hospital with fifty beds Separate rooms were used to isolate suspected cases of infectious disease

The main camp was divided into three sections Reveille sounded at 6 30 a m with cheerful music from a broadcasting van It was amusing to watch the little people folding blankets and preparing their tents with great pride and artistry for the morning medical inspection at 7 o clock Each child was seen by a doctor accompanied by an interpreter and the sick were sent to the casualty tent, which acted as a medical sieve Some were detained under observation others sent to Moorhill, and any case suspected of typhoid went direct to the isolation camp, where blood was collected for Widal reactions and specimen stools were obtained Pathological material was immediately forwarded to the public health laboratories of Winchester and Southampton Those with positive blood reactions and non-lactose-fermenting stools were admitted to the Southampton Isolation Hospital In the early days there were hundreds of cases of febrile gastro-enteritis, due to overfeeding, and our pathological friends were kept exceedingly busy

Sanitation

This proved to be a difficult problem War conditions had affected the hygienic habits of the children, who deposited faeces and urine everywhere The latrines were provided with narrow trenches, which were disinfected several times daily with chloride of lime Hedges and ditches were treated in similar fashion and burnt out Garbage was collected and burnt in incinerators Some stagnant pools were drained and a stream which ran through the camp to Eastleigh was made to percolate through a chloride of lime contact-bed The drainage system of the old manor house at Moorhill was investigated and improved As a result of these precautions flies were exceedingly scarce

On May 30 a boy of 12 from the main camp was diagnosed as a case of enteric, and on June 1 another case that of a girl of 8, occurred at Moorhill These probably were contacts from the *Habana* Fortunately, the fear of enteric scared away thousands of curious visitors and many superfluous helpers A police patrol closed the road to the camp and a strict pass control was organized Lessons in camp hygiene were given to the Spanish teachers and priests The children were fed in large marquees and forbidden to take food away Pails of dettol solution were provided outside all food tents and kitchens The children and camp personnel were trained to wash their hands before and after meals

Another case of enteric occurred at Moorhill on June 4 Up to this date evacuations to various centres in England had proceeded normally but 3,280 children were left Naturally many medical officers of health and refugee committees hesitated to receive children from a typhoid infected camp Finally, Catholic organizations and convents, which had arranged to take 1,400, refused to accept them unless they were guaranteed free from the disease As the children had by this time recovered from their under-nourishment and fatigue, more specific measures for the prevention of enteric were considered

Inoculations

A leading article in the *British Medical Journal* of April 10, 1937 (p 758), summarizes international opinion on the subject of the prophylactic value of typhoid inoculations but no opinion could be obtained as to the value of vaccine treatment given in the presence of an epidemic It is known that agglutinins appear in the blood within a week of a single subcutaneous injection of typhoid vaccine, but it is not known when an effective immunity develops After careful thought it was decided to inoculate the whole camp with two injections of T A B vaccine, at a week's interval If any child was actually incubating the disease the attack would be precipitated Widal reactions would not be reliable, but it was decided to diagnose from bacteriological examination of the stools

The Lister Institute sent 2,500 c cm of vaccine and prepared further quantities for the second dose, 1 c cm of which contained 500 million *B typhosus* 250 million paratyphoid A and 250 million paratyphoid B Doses were graduated according to age, small children of 5 receiving a first dose of 0 2 c cm, while those of 14 and adults received 0 5 c cm On June 6 7, and 8 all the children, including typhoid contacts, and the camp staff were inoculated at the rate of over 1,000 a day The children had intense faith in the procedure and neglected cinema

standard for comparison between constitutional and operative methods Some cases would probably never have been completely cured by constitutional measures alone

4 The results on discharge—that is, the immediate results—were judged on clinical grounds, taking into consideration the general health and the state of the gland areas and the overlying skin Good result means that no glands were palpable, that the sinus or scar was soundly healed, and that the general health was normal

5 Of the 119 cases admitted to the sanatorium and considered above, only 109 are available for inclusion in the table of results as for various reasons ten patients did not complete their treatment

TABLE I—*Results of Treatment (109 cases)*

	Conservative			Operative		
	Group 1	Group 2	Group 3	Group 1	Group 2	Group 3
Average total length of stay in sanatorium in months	6 7	3.25	3 0	4 3	3 0	4 0
Average length of pre operative sanatorium treatment in months				2 0	2.0	3 0
Average length of post operative sanatorium treatment in months				1 4	1 0	1 0
Good clinical results on discharge	24	6	7	45	16	6
Fair clinical results on discharge	2					
Poor clinical results on discharge	3					
No of Cases	29	6	7	45	16	6

From the above table the following points may be noted concerning the cases in each group

GROUP 1 CASES ON ADMISSION

The cases treated by conservative means required on an average 6 7 months to complete a clinical cure, and twenty four out of twenty nine gave a good result on discharge The operative cases were under general treatment for an average period of 2 9 months before they passed from this group to Group 2 or 3 and were then ready for operation After operation one month of treatment was given to allow satisfactory healing of the wound All the cases treated by operation gave good results

GROUP 2 CASES ON ADMISSION

The six cases under constitutional treatment gave satisfactory results and were retained in the sanatorium for an average period of 3 25 months The sixteen cases treated by operation all gave good results and were kept under constitutional treatment for an average period of two months before operation During this time minor operative measures, such as aspiration incision, and curettage or tonsillectomy may have been performed, and the gland may have resolved to a Group 3 stage A month was allowed after operation for the healing of the wound

GROUP 3 CASES ON ADMISSION

The statistics in this group give no useful information, as the group contains such a variety of cases of residual infection that no generalization can be made about them Thus there were cases with residual glands of long standing needing only a few weeks treatment before operation and cases with a residual sinus following an operation in a general hospital which had so far done well but which required a period of convalescent treatment to heal the sinus and to raise the resistance with a view to prevention of possible recurrence

With regard to immediate results following treatment in all groups, it will be seen that they were good except in five cases of Group 1 There is no doubt, in view of our present experience, that the treatment of these five cases should have been completed by operation It is noteworthy also that in this series of cases healing after excision occurred by first intention in every case but one

Analysis of Late Results

The late results in this series of cases have been investigated with a view to ascertaining whether the principles of treatment outlined above have been successful in practice The authors were fortunate in being able to procure the co-operation of the tuberculosis officers of the Essex County Council to whom a questionary regarding the present condition of the patients was addressed Information concerning eighty one cases in the series was received There is good reason for supposing that many of the cases about which information was not obtained did well, as some were taken off the register and others were given very good prognosis when they were discharged from the sanatorium The following table embodies the information received in answer to the questionary

TABLE II—*Summary of the Late Results of Treatment in the Series*

	Constitutional Treatment with Formal Excision (54 Cases)		Constitutional Treatment only (27 Cases)	
	No	Per cent.	No	Per cent
Present condition of neck				
Satisfactory	52	96	24	89
Unsatisfactory	2	4	3	11
Recurrence of glands	4	7	4	15
Further treatment	2	4	4	15
Cosmetic result				
Satisfactory	49	90	23	85
Unsatisfactory	5	10	4	15
Further tuberculous lesions	0	—	0	—

It will be seen from the table that the results taken as a whole are satisfactory especially in view of the fact that many of the patients in the original series have had their names removed from the registers as no longer suffering from tuberculosis The combination of constitutional treatment with formal excision gives slightly better results all round in spite of the fact that these cases were more severe In considering the question of recurrence of glands certain of the excision cases required another operation within a short time of the first one In reality these recurrent glands were missed at the first operation and were not recent developments, as they were mostly caseous and broken down The removal of a large superficial mass allows such glands to present more superficially in the neck The reoperation cases were operated upon before the patients left the sanatorium and such recurrences have not been included in the table In a few cases the recurrence of glands mentioned in the table has not been sufficient to warrant further treatment

If any note was made in the questionary that keloid scarring was present the cosmetic result was regarded as

service, and the senior student is not taught, as he should be, his relationship to the profession as a whole, to the public, and to the State It will be a long time before we can remedy that state of affairs, but until we can get the general practitioners to go out to their work with the knowledge that their duty is something more than to treat disease and to earn a living and that they cannot escape the great obligations to the State and to the public, we shall not make the advance that we wish

Ignoring the General Practitioner

The co operation of the general practitioner in the health services of this country in my view is neither desired nor allowed The local health authorities have ample power to call to their aid members of the medical profession to help them in their health work In very, very few cases have they ever exercised that option There are districts where it has been done with the greatest possible success in bringing together the profession of an area and a local health authority The local authorities have exactly the same powers with regard to education, and they invariably exercise them Why does a local authority call in expert advice to help it in educational matters, and refuse to do so in health? The inference that the general practitioner draws is that he is not wanted Then I say that his co operation is not allowed He considers that it is not allowed because he sees services carried out in his district which he himself believes he can carry out as well as, if not better than, the medical officers who are doing it, and his co-operation in that respect is largely ignored

How to Reduce the Gap

What is the result of that position? Is it not fair to say that there is a great gap between the health machinery and the public health services and the medical profession, who are dealing with the individuals that you have to attract? That gap is deplorable, and we should use every effort in our power to reduce it But it cannot be done until there is a closer association between that local health authority and the local medical profession To reduce this gap I would advocate the following machinery First of all the education of the doctor needs radically altering from the aspect of preventive medicine A second point was the subject of discussion at the meeting of the British Association—namely, adult education in elementary physiology and anatomy This would be one of the biggest factors in health education in this country that could be most easily brought about Then, thirdly, I should like to see a really considered review of the position of the medical officer of health in our great health service system And, again, I would like to see organized local medical opinion in touch with the local health authority—and from our side it would be perfectly simple to arrange Last, but not least, I would like to see a link between the local medical opinion and the centre at the Ministry of Health

---

Three further publications relating to poison gas in warfare have lately appeared One is Air Raid Precautions Handbook No 3, *Medical Treatment of Gas Casualties* issued by the Home Office Air Raid Precautions Department and published by H M Stationery Office, price 6d The second is a leaflet issued by the same Department and published also by the Stationery Office at 4d—*Anti-Gas Training* The third is a book published by the Cresset Press, 11 Fitzroy Square London, at 12s 6d and entitled *Air Defence and the Civil Population* While acknowledging information and help from the Home Office Department the authors Dr H Montgomery Hyde and Mr G R Falkiner Nuttall say that the responsibility for the statements and opinions in this book is entirely their own

SOUTH AFRICAN MEDICAL CONGRESS

[FROM OUR CORRESPONDENT IN PRETORIA]

The medical profession of South Africa met for its annual gathering during the week beginning September 20 in the Orange Free State capital Bloemfontein is a particularly accessible point, being the geographic centre of the Union, with good motor roads converging on it as well as convenient rail and air services The time of year, early spring was suitable Bloemfontein is situated on the central plateau of South Africa so that the mornings were still cold, but the crisp sunshine throughout the day was most stimulating and productive, no doubt, of equally clear thinking in the Council chambers

Though the official opening by the Free State Administrator only took place on Monday afternoon, the sections got busy in the morning and made considerable headway The Provincial Administrator in formally opening the Congress, referred to the plea made by General Smuts in 1935 for a South African point of view or rather starting point in the study of scientific problems General Smuts was referring to such subjects as geology, botany, and zoology, but one wondered whether in medical science in the Union there could not be more specialization in local problems There was not the slightest reason why we in South Africa should not do pioneer work in certain diseases in our own fields of research He was thinking more particularly of such scourges of the northern parts of the country as malaria and bilharziasis Such problems were at our doors, and we had the men and the means to undertake profound researches

The opening ceremony was attended by some two hundred doctors drawn from all parts of the country On the platform with Mr T Lindsay Sandes President of the Federal Council was the President of the Free State Branch of the Association, Dr S M de Kock, who was later inducted as President of Congress, and various local dignitaries and members of the Federal Council

Health Problems of the Union

Dr de Kock chose for his subject "The Public and Ourselves but he could only touch on what appeared to him the most interesting items and those of which he had first-hand information He considered that the main health problem of South Africa was that of making modern medical services available to the entire population, European and native at a reasonable cost to the individual and the community He emphasized that expert guidance and supervision were needed to ensure the success of any scheme of national health insurance Such guidance and supervision, he said should come from the medical profession, it should not be delegated to lay administration and lay boards as constituted at present The public as well as doctors were already suffering far too much through the delegation of hospital administration to lay boards, however enthusiastic and conscientious these might be they lacked the knowledge and the expert training which were indispensable for the success of such administration It would be nothing short of a calamity if invalidity insurance were exposed to similar risks

Speaking of the Proprietary Medicines and Appliances Bill, Dr de Kock said that as it had already passed through the Select Committee it would probably become law during the next session of Parliament It had been stated that if this Bill were passed the farmer would be prevented from acquiring medicines and home remedies This was not so, but fraudulent and misleading advertisements would be prevented Referring to the alarming increase in the incidence of tuberculosis among Europeans and natives, he said that a national policy for dealing with this problem had at last been adopted, and included rehousing of the slum population It was hoped that within five years the slums would have disappeared from the larger towns Further, the Government was devising

THE RELATION OF THE BLOOD GROUP OF THE INDIVIDUAL TO BLOOD DISEASES AND NEOPLASMS

BY

KENNETH I E MACLEOD, M B, Ch B,
Lieut.I M.S

Sometime Resident Clinical Pathologist at Manchester Royal Infirmary

It is unfortunate that unless some obvious difficulties can be surmounted little or no conclusions can be drawn from any work of this nature In the first place it is necessary to have accurate diagnosis, secondly, to examine and test a very large series of cases and, thirdly, the tests must be free from error, either in the technique employed or in the interpretation of the results The results themselves must be carefully tabulated and recorded

It is readily understood that such work as this can only be undertaken at large treatment centres, and that the observers must have sufficient time amounting to years and infinite patience Alternatively small groups of observers from the medical field of the entire world could collect their results and by pooling their material get sufficient data from which to draw conclusions It is in the latter respect that this small contribution is offered Perhaps some indication of the probable direction of the results is here presented

The Auto-agglutination Factor

The blood grouping itself and especially in so far as Group AB (Moss I) is concerned must be done accurately Factors such as the presence of auto agglutination may mask the true group of the individual case To eliminate such possible error all cases showing doubtful grouping were retested often several times The blood cells of the patient before testing against the stock sera were washed thoroughly in normal saline In such cases also, the cells of known groups were tested against the patient s sera This precaution was taken particularly in the case of patients whose blood fell into Group AB (Moss I) In some few cases even with all these precautions the blood group was indeterminate

In the cases which showed auto-agglutination—notably those suffering from gross anaemia either of a primary nature or secondary on a neoplastic state—under the aforesaid conditions it was proved, usually without difficulty that the patient was either a true Group AB (Moss I) or alternatively some other group

Case 1—W C a male suffering from a leukaemic condition of his blood was an auto agglutinator with apparent agglutination in the stock sera. The cells after being thoroughly washed showed no agglutination in the stock sera the patient of course falling into Group O (Moss IV)

Case 2—Mrs C. suffering from pernicious anaemia was also an auto agglutinator and apparently a Group AB (Moss I) but turned out to be a Group A (Moss II) on washing her cells This was confirmed by testing known cells against her serum and was reconfirmed easily when the patient recovered later from her severe anaemic condition as the auto-agglutination formerly present had disappeared

It was noted in those patients who recovered from their severe anaemic condition that the auto agglutination which had been present invariably disappeared Their blood groups were then readily determined It was also observed in those cases in which this phenomenon of auto agglutination had disappeared on recovery or improvement, and in which the original sera, stocked when the auto agglutinating properties were evident, had been kept, that the washed cells taken from the patients after their recovery showed neither agglutination in the fresh sera taken simultaneously nor in the original sera This was noted in Case 2 above and also in Case 3

Case 3—Mrs S suffering from a haemolytic anaemia was a marked auto agglutinator and a Group AB proven after taking the customary precautions Following splenectomy the patient s condition improved and she lost the power of auto agglutination She was regrouped, and was found to be a true AB Fresh blood cells taken after the improvement did not agglutinate either in her fresh serum taken simultaneously or in her original serum, taken when she showed the auto-agglutination

This auto agglutination, due to pseudo agglutination—that is to a deformation and exaggeration of the rouleau-forming power of the blood—and essentially related to the sedimentation time of the red blood corpuscles as has been already definitely established is obviously from the observations in Cases 2 and 3 mainly a corpuscular phenomenon, and only secondarily related to the patient s sera The fresh cells taken from the blood of the patients whose condition had improved sufficiently for the auto-agglutination to have entirely disappeared in the fresh sera taken simultaneously, were apparently not agglutinated in the original sera stocked when the phenomenon was evident—a fact that would indicate the cellular origin of the phenomenon On the other hand it was noted in the same cases which showed this auto agglutination and in which the cells were thoroughly washed several times in saline that they reacted accordingly to the true group of the individual in the stock sera A B O when previously unwashed, they were apparently agglutinated in all three stock sera thus giving the impression that the group was an AB also that the same washed cells were again auto-agglutinated in the sera of the corresponding patients From this it may be observed that

(*a*) The unwashed cells were apparently agglutinated in all three stock sera

(*b*) Washed they were not agglutinated in any of the stock sera if an O—and only in the appropriate sera if an A or B and in all of course if the patient happened to be a true Group AB

(*c*) The same washed cells on retesting against the corresponding auto agglutinating patient s serum showed again this auto-agglutination

This latter occurrence would lead one to believe that the serum had at least some part in the phenomenon in those cases On the other hand it has been shown that on diluting this serum through increasing dilutions the auto-agglutination became negligible in comparison with the continued agglutination in a genuine agglutinating serum, progressively diluted on a similar scale

Analysis of the Blood Disease Categories

For the purpose of this work the blood diseases were observed in three categories and the individual blood group tabulated in the appropriate category Other blood conditions such as haemophilia, purpura, polycythaemia agranulocytosis etc were grouped also, but as so few cases of these were obtainable they were not included In the latter diseases the groups of those tested were, with the exception of one B entirely A s or O s

The first category had the largest number of cases, and mainly consisted of pernicious anaemia Of the 228 cases tested seventeen were of the achrestic and eighteen of the aplastic type of anaemia

In the latter two types of anaemia two of Group AB were noted, one to each type, and in the aplastic type one

Entertainments

The Bloemfontein Committee, including the ladies had worked hard, and excellent entertainments were provided on free afternoons and at night After Dr Theron s lecture on Monday night there was a cabaret at Ramblers' Club On all afternoons there were tennis and golf at the clubs, of which delegates had been made honorary members The Orange Free State University College entertained the Congress on Tuesday night and the civic authorities to a ball on Wednesday night Thursday night was reserved for the Congress Banquet, and Friday night for old boys' dinners and the Red Cross ball Delegates returned to their homes happy but contented to resume the relative quiet of normal professional lives

SUBGLOTTIC CANCER OF THE LARYNX

SIR STCLAIR THOMSON'S ADDRESS

The annual address at the opening of the lecture session at the Central London Throat, Nose and Ear Hospital, Gray s Inn Road, was given on October 8 by Sir StClair Thomson who took as his subject " Subglottic Cancer of the Larynx The address was illustrated by lantern slides and specimens and at the close the speaker described in detail the historical case of subglottic cancer which was the cause of the fatal illness of the Kaiser Frederick of Germany in 1887–8, and the controversy to which it gave rise

Sir StClair Thomson began by remarking on the great clinical difference between those cases where a carcinoma originated in the interior of the larynx and those in which it started around the entrance to the larynx or on its outer surface Krishaber (1879) was the first to insist on the important distinction between extrinsic and intrinsic cancer of the larynx, but Isambert (1876) had already proposed that a separate class should be formed of subglottic growths—namely, those originating in the inner surface of the cord or in the subglottic area immediately below it Subglottic cancer was met with much less frequently than either the intrinsic (chordal) or the extrinsic form, and therefore experience of it was apt to be limited early diagnosis was more difficult, and the choice of surgical treatment was not so definite and did not give such good results as in intrinsic cancer proper He had not completed to date a record of all the cases of subglottic cancer encountered, but sixteen years ago, when considering the most usual site of intrinsic cancer he found that in fifty consecutive cases there were thirteen in which the subglottic region was involved

Site of Growth

A subglottic neoplasm might take its origin on the inner or lower surface of the cord, but below its free edge, which then remained intact until the growth extended up to it from below When the growth revealed itself by appearing on the edge of the cord and a laryngofissure was undertaken, the original site and the main mass of the neoplasm might be found to have been concealed from view in the retreating subglottic region The typical subglottic cancer, however, arose in the area below and distinct from the cord, sometimes as low as the cricoid ring It was generally in the middle or anterior area of the larynx It might also, without invading the anterior commissure, spread across below it to the subglottic area of the opposite side The clinical character and full extent of a subglottic growth could only be estimated approximately by holding the laryngeal mirror very obliquely, so as to reveal the cauliflower surface or the dimpling or cupping which was not unusual Impaired movement of the cord quite out of proportion to the visible growth might also prepare the surgeon for the subglottic condition As the neoplasm grew it tended to extend upwards until, when advanced, it appeared on the edge of the cord but a subglottic growth might even run its course without a cord being reached

Symptoms and Diagnosis

Alteration of voice was not the first nor an early noticeable symptom The patient might first complain of occasional "colds in the throat," and at times might feel the voice veiled and find difficulty in shifting catarrh The gradual onset of slight dyspnoea and stridor on exertion might first bring the case to a laryngologist, who might fail to detect anything serious in the early stages or notice only occasional or even variable paresis of one cord When a cord was clear, or only congested, or when the margin was simply serrated at one point, and particularly when the movement was at all impaired, careful inspection might reveal a subglottic growth

A subglottic cancer might occur in early life , even when grown to a considerable size the correct diagnosis might be overlooked by a whole group of experts Sir StClair described some illustrative cases in this connexion When an unsuspected subglottic growth extended upwards until it reached the free edge of the cord it might produce a " mouse-nibbled " ulceration, and its first appearance might simulate a tuberculous lesion A biopsy would be of help in these cases if a satisfactory specimen could be obtained Unfortunately, it was just in these cases that the site and attachment in the receding subglottic area made this difficult or impossible until the case was so far advanced that such a proceeding was unnecessary and perhaps harmful

The prognosis in all cases of subglottic cancer was much less hopeful than in intrinsic cases limited to the free edge or surface of the cord In a sequence of fifty cases of laryngofissure there were thirteen in which there was subglottic disease, and of this number seven patients, or more than 50 per cent , had died of recurrence a striking proportion when it was recollected that less than 25 per cent had recurrence in his statistics of all cases (chordal and subglottic) operated on by the laryngofissure route—these included many cases operated during the pioneer period which would not nowadays be accepted Again, impaired mobility of a cord was met with more frequently in subglottic cases, and was of evil augury

Treatment

It was a difficult question to decide whether these subglottic cases might be adequately dealt with through a laryngofissure or by a more extensive operation, generally a complete laryngectomy If the subglottic growth had not spread as low as the cricoid cartilage and had not invaded the anterior commissure or crossed to the other side, removal by the laryngofissure route might be quite successful in securing a lasting cure even if impaired mobility of the cord was noted Fixation of the cord although it diminished did not destroy the possibility of lasting cure by a laryngofissure Even a bilateral subglottic cancer, if it had not invaded the actual anterior commissure, could be successfully treated in the same way When a subglottic cancer had extended round to the opposite side, and nearly always when the anterior commissure had been invaded, a complete laryngectomy was indicated

The choice seemed to lie between these two alternatives partial laryngectomy carried out through the laryngofissure route, and a complete laryngectomy The full extent of a subglottic growth could not be correctly judged until the larynx had been split and its interior inspected *en face* The extension was generally greater than was anticipated This step might be followed by an endolaryngeal excision, if a satisfactory margin in all directions could be secured , or laryngectomy might be necessary For patients whose age health or prejudice forbade a complete laryngectomy, and for those in whom this measure did not promise success treatment by radiation should be considered In such cases it should be borne in mind that the full extent of the growths was often misjudged, and that it was

The third category included the intracranial group and some others The tumours were either non malignant types—that is, meningioma, acoustic tumours, pituitary adenoma, non malignant glioma, etc—or occasional malignant types

A few spinal tumours, etc., of various types, and others were also included There were 354 cases of known intra cranial neoplasms grouped, sixty-one of which were pituitary tumours and were dealt with separately

The latter pituitary group gave 47 6 per cent of Group O, 4 9 per cent of Group B 42 6 per cent of Group A, and 4.9 per cent of Group AB

The percentages of the larger remainder were 48 46 of Group O, 8 87 of Group B, 40.27 of Group A, and 2 38 of Group AB

The combined percentages of the whole 354 cases were 48 3 of Group O, 8 2 of Group B, 40 7 of Group A, and 2 8 of Group AB

Conclusion

In conclusion it was noted that of all the cases grouped in the hospital over the same period, in the instance of the blood diseases

(*a*) 15 12% of all Group O were blood diseases
(*b*) 15.27% " A "
(*c*) 23 65% " B "
(*d*) 39.58% " AB "

Similarly in the case of the neoplasms it was noted that

(*a*) 24.38% of all Group O were neoplasms
(*b*) 22 72% " A " "
(*c*) 25 67% " B "
(*d*) 29 16% " AB "

It will be seen by these figures that only 31.26 per cent of Group AB and 50 68 per cent of Group B were diseases other than blood diseases or neoplasms, in comparison with 60 5 per cent of Group O and 62 per cent of Group A It will be also observed how the neoplasms remained a steady 22 to 29 per cent of each group whereas in the blood diseases the As and Os were about 15 per cent and the Bs and ABs were again strikingly high in comparison—23 per cent and 39 per cent respectively

Summary

1 Before any conclusions can be formed as to the relation of the blood group of the individual to a particular disease the facts and figures from a very large selection of cases must be examined

2 This is only feasible if the observer or observers have the necessary time to spend on the laborious testing of these cases which must be very accurately diagnosed to be of any statistical value

3 It is more feasible however for a multitude of observers to note their findings regarding this relation of the blood group to the cases of any diseases at their disposal or to those of a particular disease in which they are interested and, having collected their notes to submit them to a common group of statisticians who could file the material When sufficient data had been collected conclusions of probable interest and possible value might be derived from them

4 For contrast as well as control purposes cases from the two classes of diseases chosen for this article were blood grouped Some interesting figures were noted

5 Whereas for general purposes the total percentages of blood groups of the cases of neoplasms grouped were roughly within normal limits it was noted on the other hand, that there was a strikingly high incidence of blood diseases in the blood groups B and AB It was also noted that many of the severest cases of the blood diseases fell into those latter blood groups

6 Several cases in which auto agglutination was present were grouped, and it was interesting to note one or two points about this phenomenon

7 One would have liked to have more time to spend and a larger number of cases at one's disposal in order that some definite ruling as to the ultimate direction of those figures could be established

My acknowledgements are due to Dr J F Wilkinson of the research laboratory and to the late Dr G E Loveday of the clinical laboratory Manchester Royal Infirmary—to the former for allowing me to group a series of cases of the blood diseases and to the latter for allowing me the facilities of the laboratory

Clinical Memoranda

Pre-eclamptic Symptoms following Successful Hormone Treatment of Sterility

The following case appears to be sufficiently interesting to warrant being placed on record

The patient was a married woman of 26 suffering from menstrual irregularity the cycle being lengthened to forty two days The flow when it appeared was excessively scanty and lasted only one or two hours The condition was accompanied by signs of hormone deficiency such as vasomotor instability and psychic depression and by sterility

On examination keloid scars were observed on the knee and abdomen The uterus was found to be normal in size but the right ovary was very tender and had prolapsed The distribution of bodily hair was normal but during the last six months the patient had inclined to the male type the breasts had become smaller and the female fullness about the hips had been lost She had marked sexual frigidity Her weight was decreasing.

It was decided to treat the patient with the follicular hormone progynon B oleosum (Schering) according to the following scheme an injection of 10 000 I B U to be given on the first day after menstruation had ceased followed by one on the seventh and the thirteenth and finally on the nineteenth day the injections to be supplemented by oral administration of one dragée four times daily during the intermenstruum It was decided to allow an interval in injection treatment until the next menstruation was over and then to repeat the course

The previous period had been on March 6 1936 and lasted for about three hours Following treatment a period was obtained on April 12 lasting one and a half days followed by another on May 25 which lasted three days On June 23 1936 the patient had a perfectly normal period, and she stated that it was the first she had had for some years Treatment was also successful in producing normal development of the breasts the patient becoming more feminine in appearance The frigidity disappeared The sterility was also overcome and the patient became pregnant in July Treatment was then suspended On March 13 1937 the patient complained of a swollen face and headaches There was no albumin in the urine and the blood pressure was normal

On March 15 her condition became much worse There was marked swelling of the face and ankles, and traces of albumin in her urine and for the first time she complained of spots before the eyes with difficulty in vision clinically a typical late pre eclamptic picture Her headaches were worse

OPENING OF THE NEW SESSION

CHARING CROSS HOSPITAL

LORD ADDISON ON THE FUTURE OF MEDICAL SERVICES

The annual dinner of the Charing Cross Hospital Medical School was held on Saturday, October 2, at the Café Royal when a large number of past and present students were present

Lord Addison M D, F R C S, presided, and proposed "The Hospital and Medical School" He said his association with both institutions had been at all times a cherished recollection It seemed but yesterday that he was teaching anatomy to the students Of course, if it had been under the present dispensation he would not have been there, because they had eschewed his subject nowadays, but he was always proud that the first two medical men to enter the British Cabinet happened to be professors of anatomy So perhaps there was something in it after all He recalled that in those days the hospital was always struggling against financial difficulties Mr Inman had not then been discovered Though it had been his job in State Departments to choose men wisely, he had never been able to understand such men as Mr Inman they were able to extract blood from a stone He knew of no training which, if used properly, could be of greater use than medical training He recalled the foundation of the Medical Research Council Then came the war, and there was no end to the problems which came before one in which one's medical knowledge and training were not of great use As Under-Secretary to the Board of Education he had managed to obtain grants for medical schools It was hard to believe that he had had the greatest difficulty in persuading the deans of two important medical schools to accept money from the State That was now only a memory The Government did not desire to run such institutions but wanted them to run their own affairs better, and, above all, to pay their staffs better salaries than he had received! When later the Ministry of Health was established it had been no light matter over eighteen months of struggle to persuade a number of laymen that it was a sensible thing to set up a State Department which should be concerned first and foremost with the promotion of the health of the people Lord Addison went on to say that, although things had moved so quickly during the past twenty years, there would be in the next twenty, if the country were saved from the lunacy of war, organized application of knowledge and ability in the service of the State on a much more complete and far-reaching basis It would not be long before the hospitals Charing Cross included, were all part of a great scheme of public service, but they would not be less independent than now, they would, in fact, be more independent They would be stronger and possibly more renowned, because the voluntary hospitals of Great Britain led the world as a collection of institutions engaged in the application of medical and surgical knowledge and practice He had found, if he might be allowed to say so, that many difficulties connected with the medical profession arose from the fact that it had been too self-centred While members of a profession they were nevertheless citizens, and their training was the most helpful to those called upon to exercise authority in the State It brought out that most precious and rare quality in men—common sense Speaking as one entirely outside he anticipated that at some time or other Charing Cross Hospital would be very much bigger and perhaps not where it was to-day Many present would he thought live to see a great hospital system out in the fields and fresh air with the highest skill centred in the receiving centres in the cities, the whole working together In this there must be a very important part for Charing Cross Hospital to take

Mr Philip Inman chairman of the hospital, replying to the toast, said although that was not the time to make a full statement, there was under consideration a scheme which would commend itself to everyone connected with Charing Cross Hospital The hospital's financial position was never stronger than at the present time In spite of increased taxation the income for the past year was a record, being £11,500 more than that for the preceding year That that was no flash in the pan was evidenced by the fact that this year the income was £4,500 above that for the same period of last year That financial strength would be of very great assistance when they came to implement the scheme of rebuilding In recording that the financial strength of the school equalled that of the hospital, the chairman paid a tribute to the magnificent service rendered by the dean Mr Eric Crook, and the secretary Mr Edwards Dr Edwin Warner proposed 'The Visitors,' and Mr H L Eason F R C S., Principal of the University of London, responded Mr E D D Davis proposed the chairman's health

ST. THOMAS'S HOSPITAL

OLD STUDENTS' DINNER

The annual old students' dinner of St Thomas's Hospital took place on October 8 at the Dorchester Hotel, with Dr John S Fairbairn in the chair There was a large attendance

In proposing the toast 'St Thomas's Hospital and Medical School' the Chairman said that the British Medical Association round-the-world tour in 1935 had revealed the devotion of old students to their schools, and at such a gathering as this the loyalty of those present to their alma mater could be taken for granted Dr Fairbairn spoke of his confidence in the ability of the great voluntary hospitals to weather the changing conditions of to day Most of the teaching hospitals—with their threefold functions of research, instruction, and care of the sick—would certainly survive, but they must move with the times and not merely hold to traditions of the past The keynote for the future was co operation all round, and here the organization of the British Postgraduate School pointed the way, with the Government, the University of London, and the London County Council each taking part A most important development of the activities of St Thomas's was its social service department Sir Arthur Stanley in reply, said that as treasurer he was responsible for the lay part of the hospital and had had to look at material things for the past twenty years During his period of office £526,000 had been spent on equipment and keeping the buildings up to date In his belief, the splendid support given by the public would be continued as long as the voluntary hospitals deserved it Professor L S Dudgeon as dean of the medical school, also responded, and gave a brief report of outstanding events, including the baronetcy conferred on Sir Cuthbert Wallace, President of the Royal College of Surgeons of England, the K C B for Sir Edward Mellanby, Secretary of the Medical Research Council, and Professor H R Dean's appointment as Vice Chancellor of the University of Cambridge In the past two years co ordination between the medical schools of London had advanced, more than justifying the pioneer work in this respect of Bart's, Guy's, and St Thomas's, there was now a better spirit all round Professor Dudgeon then proposed the health of the guests, giving a friendly welcome to them all, with special mention of Professor T B Johnston, dean of Guy's Hospital Medical School, who had been appointed medical superintendent of Guy's in succession to Mr Eason

In replying for the visitors Sir Ewen MacLean President of the British College of Obstetricians and Gynaecologists, said that St Thomas's was enviable for its great

chronic laryngitis and pachydermia in the American of the near future There is one part only of the book that is not Jacksonian, but inserted for the sake of completeness The Jacksons do not themselves practise the operation of laryngectomy the one thing they do not do to the larynx, but why such an extraordinary method of excising the larynx should be advocated is beyond understanding

THE BACKWARD CHILD

The Backward Child By Cyril Burt M.A D.Sc (Pp 694 illustrated. 20s. net) London University of London Press 1937

Dr Cyril Burt in his study of the subnormal child has followed up his book on 'The Young Delinquent' with a further volume on The Backward Child It follows much the same plan as the former volume, and is characterized by all that thoroughness and skill which the author has shown in his previous publications It is a large book and is a comprehensive—one might almost say complete—account of what is at present known of the class of child with which it deals as distinguished from the normal child on the one hand and the technically mentally deficient child on the other As one would suppose the work is intended primarily for the school teacher especially the elementary school teacher, but it will be found of special value also to school medical officers, to social workers and indeed to all who are interested in the welfare and education of children It contains many useful illustrative tables and a number of interesting photographs

It is a thoroughly practical book The author is more concerned to help the teacher in his work than to propound psychological or genetic theories He emphasizes first of all that the generic terms dull and "backward" cover a great variety of conditions, that 'every case' is unique and that no case can be properly dealt with in the absence of a somewhat elaborate scientific investigation, an investigation which must be carried out primarily and for the most part by the teacher himself whatever help he may receive from others on particular points The causes of backwardness as well as the forms in which it manifests itself are equally various, and Dr Cyril Burt's book is mainly given up to showing how a backward child should be submitted to investigation, and by taking the several possible causal factors seriatim and expounding them and their modes of action Successive chapters review social and scholastic conditions, including irregular attendance or inefficient teaching at school and poverty and environment in the home physical conditions including defects of development and of general health special sensory and motor defects including those of vision and of hearing, intellectual factors, whether of general intelligence or of special capacities and defects of temperament and character All these are clearly and carefully assessed and explained and there are two particularly full and very valuable chapters on left handedness and on defects of speech

Dr Burt is very careful in drawing inferences He points out that simply to enumerate the conditions in a backward group alone would of itself prove little or nothing and that the study of a control group of normal children is indispensable He insists that in all but a very small number of cases several of the untoward circumstances combine to produce the result For instance stupidity is not the inevitable result of poverty though poverty seems its commonest concomitant and even when defective inheritance seems a predominant factor there are almost always others which are contributory to a greater or less degree As adverse conditions are multiple and complex so single or simple remedies are usually unavailing The most powerful influences are the efficiency of the mother and the understanding and skill of the teacher though in many cases the care of the doctor also is essential The facile hopes and ill founded opinions of the fond parent, the inexperienced teacher, and the family doctor imperfectly acquainted with the fundamental condition and contributing causes, are strongly to be deprecated No more valuable piece of work than this comprehensive and wise and authoritative book has yet been done to enable all these and others interested to appreciate what dullness or backwardness in a child means how the various causes can affect the child in numerous ways and how much can be achieved by medical social, and educational agencies to avoid the untoward consequences of an imperfect or wrong diagnosis and to ameliorate the condition when it has been discovered at an early stage in a vast number of cases

NEURO PSYCHIATRY AND ENDOCRINOLOGY

The 1936 Year Book of Neurology Psychiatry and Endocrinology Edited by Hans H Reese M D Harry A Paskind M D Ph D and Elmer L Severinghaus M D (Pp 800 3 dollars or 12s 6d postage 6d) Chicago Year Book Publishers London H K Lewis and Co Ltd 1937

This yearbook for 1936 continues the excellent record of its predecessors Its usefulness is enhanced by the introductions by the editors of each section in which they stress what they regard as the most significant advances of the year Thus under the title 'Constitution Heredity Allergy' there is an interesting review of Petersen's study of the contrasts between pyknic and leptosomatic types in which he tries to correlate the temperamental with the biochemical characteristics One is not altogether convinced but such an approach should stimulate further research In the treatment of myasthenia gravis we are told that the effects of prostigmin can be prolonged by oral administration of 3 grains of potassium chloride four times daily at two-hourly intervals, and that when doses exceeding 1 mg of prostigmin are required abdominal discomfort can be avoided by giving 1/100 grain of atropine sulphate at the same time Gray Walter's studies on the localization of cerebral tumours by electroencephalography receive the full attention that they merit

The treatment of schizophrenia by the induction of hypoglycaemic shock with insulin is perhaps the most novel and controversial development of psychiatry during the period under review Some observers think that all that this method can achieve is to hasten and prolong the remissions that normally occur while others conclude that the figures for remissions under this treatment are in such marked contrast to any hitherto published that there can be no doubt as to its value The most plausible theory as to its mode of action is that it stimulates carbohydrate metabolism in the central nervous system Allied to this is the use of insulin, combined with dextrose if necessary, to combat withdrawal symptoms in morphine or heroin addiction Piker reports ten cases successfully treated thus He suggests that there is some relation between addiction to morphine and carbohydrate metabolism Certainly here as elsewhere insulin greatly aids in re establishing adequate nutrition but this is not enough to explain its immediate effect in relieving the patient's distress

Herrick's views on psychiatry (page 311) are not complimentary he regards it as the last stronghold of those mystics who rest content with the disembodied functions

view of the road ahead, an improvement that should make for greater safety in driving Another practice widely adopted is that of fitting twin windscreen wipers, so that the passenger as well as the driver may have the advantage of a clear windscreen in rainy weather Direction indicators are, of course, now a standard fitting with all cars, being usually sunk in the pillars between the front and rear doors In many cases they are of the self-cancelling type, which relieves the driver of the need to remember to drop the arm when the turn has been completed Instrument boards continue to show modifications for the better, the instruments being centrally grouped, so leaving space for large cubby-holes A useful fitting on some cars—and one that might be more generally adopted—is a light bar below the left side of the instrument board by means of which the front seat passenger may assist himself, or herself, in dismounting from the car

In most covered vehicles more attention has also been paid to the matter of preventing fumes from the engine entering the interior, and better provision for ventilation has been made In some cases, for winter use, heating apparatus of one kind or another is being provided Doubtless as the result of feminine influence, manufacturers are offering buyers a much wider choice of colours, both in exterior paintwork and interior upholstery this applying to what are known as mass produced vehicles as well as to the more expensive cars

Mechanical Improvements and Modifications

The majority of motorists to day take but little interest in the mechanical details of cars, it being sufficient for them that the vehicles shall be reliable comfortable, and not too costly to run and maintain It may be noted however, that there is a tendency to adopt engines with overhead instead of side valves, a notable new adherent to the overhead type being the Morris Co, which is using it on all its models above 8 h p All the vehicles exhibited, except two makes, have engines with either four six, or eight vertical cylinders, the exceptions being the Jowett, which remains faithful to a two- or four-cylinder horizontal power unit and the German D.K W which is the only car exhibited with an engine working on the two- instead of the more usual four-stroke principle Petrol is, of course, the fuel used for all these types, but this year there is a novelty on the Citroen stand in the way of a 15 h p car fitted with a Diesel or heavy-oil engine

Easy Gear Changing

On British cars gearboxes with four forward speeds are now usual, on American cars, however, only three speeds are usually found, but the gear ratios are so chosen that satisfactory results are given in practical use, and in this connexion it is interesting to note that an all synchromesh three-speed gearbox has been adopted in place of four speeds on the 25 h p Vauxhall

During the past summer many references have been made in the motoring press to the probable introduction of "two-pedal" car control, making clutch action automatic and so rendering the familiar clutch pedal unnecessary Apparently such rumours were not well founded, as there is no startling departure in this respect at the show It is true of course, that the Daimler and Lanchester concerns still retain the fluid flywheel system of transmission, and the Armstrong-Siddeley the self-changing gearbox which they have used for many years past but the improvements effected in synchronized change-speed gears appear to have done away with the difficulties formerly experienced with gear changing There has also been much talk during recent months of "over-drives or something more than the usual direct top gear, for use on level open country roads, but while they are provided on a few makes of cars they are the exception rather than the rule while as regards free wheels in conjunction with gearboxes these show no increase In view of the higher speeds now being attained on roads on which speed is unrestricted considerable attention continues to be devoted to providing cars with powerful, reliable brakes, which continue to undergo improvement both as regards their means of adjustment and the readiness with which brake linings can be renewed when necessary Nowadays with so many service stations at which cars can be regularly and efficiently lubricated at a relatively small cost motorists are not so much interested in the lubrication details of their cars, it is satisfactory, however to find an extension of the use of grouped chassis lubrication points, which is an advantage to those who prefer to look after their own cars

Independent Front-wheel Suspension

One of the features of the 1938 cars is the almost universal use of road wheels of the steel spoked, 'easy-to-clean type, the wire-spoked variety so popular a few years ago being now rarely seen Independent front wheel suspension in place of the usual longitudinal, semi elliptic springs is increasing in popularity, it being found on more makes of cars than last year, notable additions being the Daimler Fifteen, the Hillman and Lanchester Fourteens, and the 14 h p and 20–90 h p British Salmsons The front-wheel drive, while still found on certain Citroen and other cars does not appear to have proved popular in this country, a back axle driven by a propeller shaft and spiral bevel or worm gearing continuing the order of the day One useful departure is an increasing use of adjustable steering columns, so that the length of the column may be adjusted to suit drivers of varying stature The number of cars fitted with permanent jacks continues to increase, these proving useful not merely for wheel changing when punctures—now very rare owing to the reliability of modern tyres—are encountered, but also for raising the wheels clear of the ground during bodywork and chassis cleaning operations A few of the more expensive cars include a wireless set among the special fittings, but despite the many automobile radio receivers now available they are still far from being widely used A practice that does not recommend itself to many owner-drivers is that of locating the radiator filler cap below the engine bonnet instead of externally in the top of the radiator as in earlier years Although radiators do not often need replenishing with water it is a nuisance, when this is necessary to have to raise the engine bonnet, and if one is not careful there is the added inconvenience and annoyance of spilling water over some of the engine components To sum up, it may be said that both as regards the mechanical portion and the bodywork of cars the 1938 models are based on last year's well tried designs, the alterations consisting rather of detail improvements and modifications than any radical departures from previous designs

Some New Cars

In view of the attractive prices at which they are available, one of the features of the exhibition is the increasing number of 12- and 14-h p cars, some of which are still fitted with six cylinder power units, but among which as already indicated, are several with four-cylinder engines Some of the 14 h p cars form excellent family vehicles having ample room for five persons, and, in view of the fact that they are only subject to an annual tax of £10 10s are likely to prove very popular during the coming season In addition to those already mentioned, among the new cars which will be found worthy of inspection are the 12–70-h p four-cylinder Alvis, the Big Seven and 18 h p six-cylinder Austins, the Daimler Fifteen with independent front-wheel suspension the Hillman Minx and Fourteen, the new Humber Sixteen with 'Evenkeel suspension, the 12-h p Morris, the 16-h p Riley with three speed synchromesh gearbox and dual automatic over drive giving five forward speeds in all, the attractive Triumph and S S Jaguar cars, and the range of Singers, Rovers, and Flying Standards Although most of the British car manufac-

brighten the greyness of his daily life The work consists of an anthology of pithy sayings by medical men from Hippocrates to Sauerbruch and by laymen from Sophocles to Schopenhauer, as well as comments by Dr Liek and Herr Klussmann Indexes of names and subjects would add to the usefulness of this delightful little book

Dr Charles Newman broke new ground six years ago when he wrote his small practical book *Medical Emergencies* For a second edition (J and A Churchill, 8s 6d) the author has revised his material and made several improvements The account of gas poisoning has been rearranged to include the war gases The description of the technique of blood transfusion has been rewritten in the light of Creed's discovery that the reactions after citrate transfusion can be avoided by using only freshly distilled water A note on the treatment of pain in general is substituted for the section on migraine There are new sections on coma in hot climates, asthma and the treatment of haemoptysis by artificial pneumothorax Agranulocytosis receives notice in the section on miscellaneous emergencies

Preparations and Appliances

SIMPLE TRACTION TABLE FOR HIP NAILING OPERATIONS

Mr R Watson Jones F R C S (Liverpool) writes

An inexpensive traction table has been designed on the simplest possible lines for plaster work and hip operations

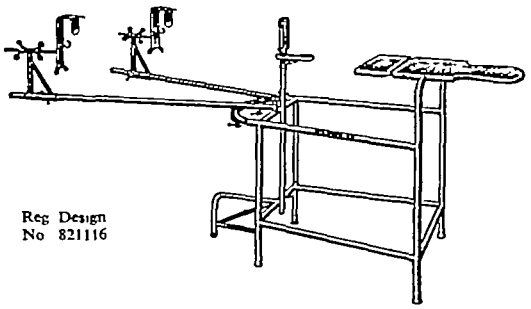

Fig 1

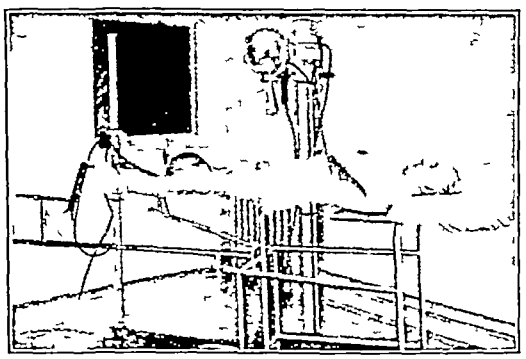

Fig 2

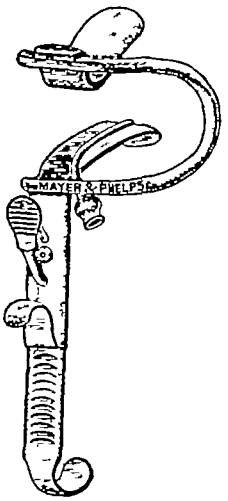
Extra articular nailing in fractures of the femoral neck and in arthrodesis of the hip joint demands radiographic control and easy access to the hip and thigh Every unnecessary joint bar and screw has therefore been discarded The framework has been removed as far as possible from the hip to facilitate towelling and aseptic technique and to avoid interference with lateral and antero-posterior radiography (Fig. 1) The perineal post is constructed of wood with sorbo rubber protection for the perineum and the pelvic rest is of aluminium so that there is no opaque shadow on the x ray film and both can be boiled

There is no table top to be lowered by complicated mechanism so that the freest possible access is allowed to the front side and back of the hip-joint The shoulder rest can be lengthened or shortened for patients of varying size The foot pieces are of a simple type to which the limbs may be fixed by strapping or plaster



The foot extension bars may be removed to facilitate transport On the suggestion of Mr G Pulvertaft, the four main longitudinal bars are now divided centrally so that the table may be completely dismantled into two halves and quite easily carried by one person or put in the back of a car Figure 2 shows the table in actual use for nailing after arthrodesis of the hip Two Siemens heliospheres are used for radiography

The table is made by the Holborn Surgical Instrument Co Ltd and it costs £19 10s (with chromium plating £25)

MODIFIED BOYLE-DAVIS GAG

Dr Alex Russell (Southampton) writes

I have devised an attachment for the Boyle Davis gag which consists of a metal plate fitting on to the palate and alveolus

of edentulous patients It is easily inserted firm in position and is interchangeable with the usual hooks which fit on to the upper incisors and which readily slip when these teeth are absent

A HOSPITAL MATTRESS

Dr H Roland Segar (Wellhouse Hospital Barnet) writes

In connexion with the equipment of a new puerperal sepsis block where mattresses will be frequently sterilized I experimented some months ago with various types of mattresses In the type finally selected the interior spring is a continuous hand woven high tensile steel wire guaranteed for five years It will withstand without deterioration many hours in a high pressure steam sterilizer owing to a patented process the wire does not rust nor is the resilience of the spring affected There being a continuous weave individual springs have no joins and there is therefore no noise There are no projections to wear through the coverings and the weight of the patient is evenly distributed over a considerable length of wire The other advantages of this kind of mattress are that there is no displacement or sagging the covering is of greatly increased durability compared with those in general use there is uninterrupted ventilation through the entire spring to the outside air it can be used unaltered for nursing in the Fowler position it can be lifted easily by one person and the usual handles are provided on either side and finally it can be rolled The mattress is manufactured by the Raco Epeda Co Ltd Colnbrook Mills, Colnbrook Bucks

AETIOLOGICAL PROBLEMS OF CANCER AND TUBERCULOSIS

On October 4, 5, and 7, at the London School of Hygiene and Tropical Medicine, Dr GEORG WOLFF of Berlin delivered three university lectures on aetiological problems of tuberculosis and cancer In the first two lectures Dr Wolff traced the medical statistical history of mortality from tuberculosis, indicating the more important sources of data and their defects He enumerated the several aetiological factors, such as extent of infection, racial or individual constitution, environmental conditions, and illustrated various statistical methods of evaluation He concluded that environmental factors have been not the sole but the principal factor of declining mortality, above all a higher general standard of nutrition, and that in improving that part of the environment which, unlike climate, is amenable to human control, future declines of mortality may be effected

In the third lecture Dr Wolff dealt mainly with the supposed racial factor in the aetiology of cancer He first showed the results of a full analysis of the rates of mortality of Jews and non-Jews in Berlin These data, the first yet obtained in Germany in which the information was sufficiently complete to admit of the calculation of rates of mortality at ages and for sites, show that on the whole the rate of mortality from malignant disease among the Jews was rather below that of the general population, but the two rates were tending to approximate Thus standardized rates (the census population of Germany in 1910 was used as the standard population) in 1924–6 were, for Jews males 8 5, females 11 7 per 100,000 for the general population of Berlin 10 4 and 12 6 In 1932–4 the corresponding rates were 9 2 and 11 4 for Jews, 10 2 and 11.9 for the general population The localization of malignant disease differed between the two groups In Jews malignant disease of the lower part of the digestive canal was more frequent and of the upper part less frequent than in the general population Jewesses suffered less from cancer of the uterus and more from cancer of the breast than the general population of women

Dr Wolff called attention to the necessary ambiguity of many results since they might be interpreted either as racial or environmental He referred to work which has been done on such problems as the effect of circumcision in lessening the liability to malignant disease, and pointed out that one had here a wide field for useful research in which clinical, experimental, and statistical methods might be used in co-operation

---

At the meeting of the Society of Public Analysts and Other Analytical Chemists, held on October 6 with the president, Dr G ROCHE LYNCH in the chair, a paper on 'Fluorine in Food Products" was read by Mr H C LOCKWOOD He said that the fluorine in various food products had been separated by distillation at 135° to 150° C in an apparatus containing glass wool and sulphuric acid and determined by means of a zirconium and alizarin reagent The amounts found in many substances such as biscuit, gelatin, flour, glucose, cocoa, and egg-yolk were *nil* or insignificant (0 5 to 2 parts per million) but the observation of Reid, that tea contained appreciable amounts of fluorine, had been confirmed Thus China tea contained 40 and Indian tea 60 parts per million Approximately 75 per cent of the total fluorine present would be found in an infusion made with tea

---

A proposal is on foot to issue a public appeal in South Africa for £100 000 to establish a Cancer Research Institute at Johannesburg as a memorial to King George V The Union Government will be asked to contribute £50,000

Local News

INDIA

Progress in Public Health

In his report for 1935 Colonel A J H Russell, I M.S, Public Health Commissioner with the Government of India calls attention to various sociological and health problems which cannot be overlooked even in a year which was "if anything rather less unhealthy than usual" The population is still increasing steadily in British India, the birth rate having remained fairly stationary since the beginning of the century, while the death rate has been decreasing for all age groups except for that of 60 years and upwards It is estimated that in the absence of abnormal epidemics or famine conditions the population of India will approximate 400 millions when the next census is taken in 1941

CHIEF DISEASES

Plague has steadily declined, but this is not attributed to permanent improvement in sanitary standards, housing and other conditions favourable to the rat population being generally much the same as when this disease first made its appearance in Bombay forty years ago It is suggested that there has been an increased immunity among rats in places where there have been repeated epidemics that the incidence of disease among them has consequently fallen and that the human population has therefore been less infected The type of plague has been almost entirely bubonic the pneumonic form being rare and very restricted Climatic influences are thought to act through their effect on the total flea prevalence, the length of the life of the flea and the production of Bacot s "blocking phenomenon in relation to these two factors In 1935 the mortality rate from this disease was only 32,000, as compared with previous annual rates approximating half a million Small-pox epidemics were more marked than in the four previous years, the Deccan and the plain of the Ganges were the most seriously affected In the Bombay Presidency the incidence was the highest since 1930, and urban death rates were, as usual, generally much higher than the rural ones Colonel Russell points out that only very rarely are vaccinated persons attacked, but that the occurrence of relatively free years induces a measure of carelessness as regards vaccination among the general Indian public, which in due time results in epidemics among the unprotected Vaccination work is also handicapped by defective health organizations in some of the provinces, where supervision is either inadequate or perfunctory and reporting of out breaks of small-pox is delayed Registration of births is unsatisfactory still, and Colonel Russell emphasizes the desirability of employing female vaccinators for work among women and children and the more careful supervision of the vaccinators already at work in some districts It is suggested that the disease now prevalent in India is less virulent than it was formerly The rise in the cholera mortality curve noted during 1933 and 1934 continued during 1935, but the peak did not approach that commonly in evidence before 1921 Rural areas suffered more severely than urban, but there was always clear evidence of the close relation between outbreaks of disease and faulty water supplies and general sanitation Colonel Russell adds that inoculation with cholera vaccine still remains the most effective method of personal prophylaxis Choleraphage was effective in certain areas and in the Muzaffarpur and Purnea districts, where full statistical details were obtained it was shown to cut short the course of prevailing epidemics provided that immediate steps were taken to deal with the whole population Both as a curative and as a prophylactic measure choleraphage achieved

figures showing how high an intake of vitamin B_1, mainly in the form of bread, was provided even by the poor person's diet before the introduction of the modern white-flour bread Thus, in 1670 the soldier's ration contained 1 000 units of B_1 a day in 1782 the diet of the parish poor contained 660 to 850 units, and in 1838 the Poor Law diet, City of London, contained 1,230 units A very different picture is seen now the "daily vitamin B_1 intake ranges from about 290 units at the lowest income level to 450 to 550 units at the two highest income levels Thus the best-fed members of the population to-day, while getting twice as much vitamin B_1 as people on a low income level, yet consume less vitamin B_1 than the parish poor of the eighteenth and early nineteenth century" Cathcart and Murray found that in fifty-three families, consuming over 3 000 calories per man per day, 64 per cent of the calories are derived from foodstuffs poor, or completely lacking, in vitamin B_1—that is meat, bread, and sugar There is therefore good reason to regard vitamin B_1 deficiency as an outstanding fault in the diets of many millions of people in this country This being so it becomes necessary to learn what effects this chronic deficiency is having upon them Many years ago (1918–19) McCarrison, as a result of his experiments upon animals, concluded that the deficiency existed and that its effects were manifested chiefly as disease of the gastro-intestinal tract In this connexion Baker, Wright, and Drummond refer to the results of an experiment carried out by them

It was planned to demonstrate the types of disorders which arise from subsistence for long periods on diets deficient in vitamin B, and consisted in observing two large groups of rats (approximately 500 in each) one of which was fed on a diet planned to be satisfactory in every respect while the other was defective in vitamin B (The investigation was planned and begun (1931) before the differentiation of the components of the so-called B complex had been achieved In the light of later work it seems certain that the significant difference between the two diets was in respect of vitamin B_1—aneurin) The deficiency in the second diet was not so great as to produce an acute condition in the animals, indeed, the amount of vitamin was from time to time regulated so that although growth and development were not seriously retarded there was never sufficient for the full physiological needs The most striking difference noted between the animals of the two groups concerns the incidence of lesions of the gastro-intestinal tract—20 per cent in the group receiving the "adequate diet" and 63 per cent in the group receiving the "deficient diet No fewer than eighty of the deficiently fed animals had chronic ulcers of the stomach, seven of which perforated Also marked, but not so impressive, is the greater incidence of cardiac and renal disorders in the rats fed on the deficient diet While it may be doubted whether the "adequate" diet was indeed adequate, these results must be regarded as highly significant "they fully support the view expressed so often and so emphatically by Sir Robert McCarrison that vitamin B deficiency is responsible for a very large number of the common disorders of the alimentary tract" In a lecture delivered before the Royal College of Surgeons of England and published in this *Journal* in June, 1931, he said "Of all the faulty diets I have used that composed of white bread, margarine, tea sugar, jam, preserved meat, and scanty overcooked vegetables—a diet in common use by many people in this country—proved to be one of the worst, and most likely to be associated in rats with many of the morbid states I have mentioned, especially diseases of the lungs and gastro intestinal tract"—diseases, we may add, from which one in every three sick persons among the insured classes in England and Wales suffers

CONTROL OF DANGEROUS DRUGS

The Council of the League of Nations at its meeting last month received a report from its Advisory Committee on the Traffic in Opium and Other Dangerous Drugs Since 1928 the world manufacture of morphine has fallen from 58 tons to 31 that of diacetylmorphine from 3½ tons to less than half a ton, and that of cocaine from 6½ tons to 4 tons, and it is now considered that the world consumption of these drugs is nearly approximating to legitimate needs though there are disquieting reports about poppy cultivation and the manufacture of opium and heroin in Manchukuo In the years 1925–30 the illicit traffic in morphine increased to a far greater extent than was realized At least 90 tons of morphine manufactured during that period in excess of legitimate requirements passed into illicit traffic A subject now engaging attention is the medical use of codeine as a substitute for morphine and the possible danger of its abuse as a drug of addiction A special investigation on this subject in which expert advice is being sought from scientific institutions, is now proceeding The committee is anxious to keep in touch with experiments in replacing narcotic drugs by other analgesic substances, the representative of Poland reported on some experiments carried out at Vilna with a product known as cephaline for relieving pain in cancer cases and some work of the kind is going on in Japan The comparative

is an improvement on that of the previous year Most of the cases were sporadic, but there were two outbreaks in institutions There were seven deaths The whole report makes rather sad reading but it must be remembered that not only is Newcastle one of the most densely overcrowded areas in the kingdom, but also that the city and district suffered very severely from the economic depression The health authorities have therefore to face an uphill task

Harrogate New Baths

The ceremony of laying the foundation stone of the New Royal Baths at Harrogate was performed by Sir Kingsley Wood the Minister of Health, on October 6 In the presence of a large and representative audience the Mayor welcomed the Minister, and reminded his audience that the first step in the spa development scheme had been taken four years ago when the new sun colonnade in the Valley Gardens was opened by Lord Horder These new baths were a further instalment of the development After the stone had been laid by Sir Kingsley Wood and dedicated by the Bishop of Ripon, the president of the Harrogate Medical Society (Dr Sinclair Miller) conveyed to them the thanks of the town for the services they had rendered and coupled the name of Lord Horder with the resolution Sir Kingsley Wood, in responding expressed his admiration of Harrogate and the great benefit he had derived from its waters on many occasions He referred to the enormous industrial waste and invalidity caused by chronic rheumatic affections, and made reference to the valuable research work that was being done in the rheumatic research department of the Harrogate Royal Bath Hospital in conjunction with the Leeds University in elucidating the causes of rheumatism and in the advancement of treatment Lord Horder, likewise responding, said he was pleased to be present at the ceremony as it gave him an opportunity of showing his belief in Harrogate and its waters He had great faith in the potential benefits of Harrogate to mankind

Further Great Gifts to Oxford

Lord Nuffield has announced his intention to give £300,000 to the Radcliffe Infirmary, Oxford This is his second large donation to the hospital, to which he had already given £150,000 The latest gift will form an endowment fund, the income from which will go towards raising the standard of the services Mr W M Goodenough, president of the Oxford and District Joint Hospitals Board, said on October 8 that when Lord Nuffield made his great benefaction to the University Medical School and founded the Nuffield Trust he had in mind not only the development of medical research and teaching in the University of Oxford, but also of the local hospital provision, where they might aim at services which would, in time, perhaps serve as a model of their kind

As we go to press it is announced that Lord Nuffield has offered the University of Oxford £1,000,000 (including a building site valued at £100,000) for the building and endowment of a new graduate college to be devoted to the collaboration, particularly in social studies of scholars and of practical experts This new college will—to quote from Lord Nuffield's letter to the Vice Chancellor—foster co-operation not only between the scholar and the man of affairs working in the same field, but also between the workers in different fields' Two further gifts by Lord Nuffield to Oxford were announced at the same time They are £100 000 for the erection and endowment of a new laboratory of physical chemistry, and £200 000 for the erection of buildings at hospitals associated with the medical research scheme endowed by him last year

Work of a Medical Charity

At the last quarterly court of the directors of the Society for Relief of Widows and Orphans of Medical Men, with Dr C Kempster, vice-president, in the chair, the audited accounts for the half-year ended June 30 were presented During this period a sum of £2,195 was distributed among the sixty widows and nine orphans in receipt of relief Special grants amounting to £52 10s were made to enable two orphans to continue medical studies The death of a widow, who had been in receipt of grants for the past nine years, was reported She had received in grants £630, and in addition £262 10s to assist her to pay for the medical education of her son, who has now qualified Owing to the increase in the number in receipt of grants the directors regret that there will not be sufficient funds available to make the widows a Christmas present this year, but each orphan will receive £5 Of the sixty widows on the books, two are over 90, five over 80, and nine over 75 The question of celebrating the one hundred and fiftieth anniversary of the foundation of the society next year was mentioned, and it will most probably take the form of a dinner The question will be fully discussed at the January meeting of the court Membership of the society is open to any registered medical man who at the time of his election is residing within a twenty-mile radius of Charing Cross Full particulars may be obtained from the secretary at 11, Chandos Street, Cavendish Square, W 1

SCOTLAND

Health of Glasgow

The annual report of Dr A S M Macgregor medical officer of health for Glasgow, states that the general death rate for the city during 1936 was 14 5 per 1,000 of the population, as against 13 8 in 1935 , the lowest death rate on record was 13 4 for 1933 The increase was attributable to epidemics of measles and influenza and the prevalence of diarrhoeal disease in young children The two chief features of the vital statistics of recent years had been the falling death rate and the falling birth rate When the Glasgow death rate was analysed it was found that the greatest saving of life had been effected at the younger ages, chiefly between 2 and 5 years Comparing the deaths at these ages in the year 1900, four children had died in that year for each one who died in 1936, and going back to 1870 the proportion had been seven to one The infantile mortality for the year 1936 was 109 per 1,000 births, this figure being the highest with one exception since 1924 Compared with the other large Scottish cities it was relatively high, the figure for Edinburgh being 68, for Aberdeen 70, and for Dundee 81 Scarlet fever had been responsible for 54 deaths, an unusually low figure, measles for 311, and whooping-cough for 117 There had been an unusual outbreak of paratyphoid fever, with a total of 200 reported cases and six deaths It occurred in the early months of the year and no definite cause had been assigned to it , there had probably been many more mild and undetected cases There had also been a considerable prevalence of dysenteric and diarrhoeal affections, mostly in young children and mainly in the poorer quarters of the city, and this had been the chief cause of the rise in infantile mortality It had been broadly related to housing and to maternal efficiency, and investigation showed that it was definitely graded throughout the various housing schemes, from a low rate in rehoused areas to its highest rate in slum areas The report regrets that building difficulties have slowed up the rate of closing unfit houses

Honyman-Gillespie Lectures

A series of eight postgraduate lectures, which are open free to all medical practitioners, will be delivered in the Royal Infirmary of Edinburgh this autumn under a grant received from the Honyman Gillespie Trust The lectures are connected with an eight-weeks course on internal medicine, in which different sections of medicine are

THE FEELING OF HEALTH IN DISEASE

The physician, who is daily confronted with symptoms of disease seldom considers that there is a problem in the feeling of health Schilder in a recent article [1] contends that the experience of health is too often taken for granted and is regarded merely as the reflection in consciousness of a healthy physiological state of the body Actually an inner sense of health is often present with serious organic disease and as such is the expression of adaptive tendencies in the psychic sphere analogous to regeneration and functional adaptation to trauma as seen in lower animals There is psychogenic health as well as psychogenic disease Patients with organic disease frequently attempt to maintain the experience of health by neglecting their symptoms or by deceiving the self as to their seriousness Schilder believes that such repression is possible since the immediate experience of organic disease is at the periphery of the personality, while psychogenic illness is in the core of the personality An entirely different attitude results towards illness in the two groups This difference is particularly clear for example in organic as contrasted with functional impotence In the former case the patient may behave with calm resignation while neurotic impotence causes distress which permeates the whole life behaviour Schilder gives verbatim reports from patients with carcinoma nephritis and severe organic heart disease which express a greater feeling of optimism and well being than was rightly to be expected When symptoms cannot be kept from entering consciousness delusional ideas of health may protect the patient from knowledge of disease On the other hand with lesions in parts of the body which psychologically represent organs of deep value for the personality—for example eyes breasts sexual organs —there is apt to be acute psychic awareness even though the disease objectively viewed is not serious It must be admitted however that a mild organic lesion may form the nucleus for exaggerated manifestations of illness Certainly appreciation of disease varies with the general state of mind The experience of health therefore is dependent not only on the organic state but also on the problems of the person Diseases such as multiple sclerosis and sensory aphasia are noted for the carefree attitude of the patient in the face of serious disability Spes phthisica is another example of this A consideration of many organic brain diseases leads the author to conjectures upon the localization of lesions accompanied by unwarranted feelings of well being He concludes in brief that lesions of the periventricular grey matter are commonly associated with such conditions and that in certain lesions of the parietal lobe there is lack of appreciation of disease In general the theory is that the experience of health though an attitude of the personality is dependent upon functions of specific centres in the brain Finally Schilder emphasizes the need for keener observation of psychological reactions in organic disease and points out that it is an integral part of treatment to lead the patient back to a true appreciation of his illness It is doubtful if all the different reactions which Schilder describes can be included under the single concept, "experience of health" The positive feeling of well-being springing from healthy and harmonious physiological function must be distinguished from the more negative failure of appreciation of disease whether it be due to disorganized ego function or not Furthermore the quality of the mental state of "carefreeness" in organic disease undoubtedly differs from the normal healthy state An even greater cleft separates the diffuse "feeling tone" of well-being from false ideas of health resulting from mechanisms of either repression or projection All these considerations cast grave doubts upon the existence of "centres" subserving a unitary organized function maintaining the "experience of health" Nevertheless concurrence of severe organic disease with mental states of health well being and optimism is an indubitable fact which it is easy to disregard and which has ramifications both in diagnosis and treatment.

CANCER OF THE UTERINE CERVIX

It is the intention of the League of Nations Health Organization to issue a series of annual reports on the results of radiotherapy in cancer of the uterine cervix The first of these has just appeared [1] and deals with the results in patients treated in 1930 and also in previous years These findings were collated in 1936 The present work is the outcome of suggestions made at the Zurich Conference in 1934 that such results should be assessed at periods of five six seven or more years after treatment The first report is necessarily of a more or less tentative character while the information it contains is mainly limited to those clinics which were associated with the earlier work of the Radiological Subcommission In order to obtain adequate statistical data further collaboration is both needed and invited and the general lines upon which it can be most advantageously conducted are indicated in the preliminary sections of this report The results from six centres are statistically analysed and it may be noted that three of these centres are English—the Liverpool Radium Institute the Marie Curie Hospital and the London County Council Radium Centre for Cancer of the Uterus Once more the fact is emphasized that if treatment is to be successful it must be early Cases are divided into four groups according to the scheme drawn up in 1929 each group indicating the stage to which the disease had progressed at the time of beginning treatment. This classification is reprinted and as it is almost universally used it may be of use to non specialist readers to reproduce it

Stage I Growth strictly limited to cervix uteri Uterus mobile
Stage II Lesion spreading into one or more fornices with or without infiltration of the parametrium adjacent to the uterus which still retains some degree of mobility
Stage III (*a*) Nodular infiltration of the parametria on one or both sides extending to the pelvic wall with limited uterine mobility or massive infiltration of one parametrium with fixation of the uterus (*b*) More or less superficial infiltration of a large part of the vagina with a mobile uterus (*c*) Isolated metastases in the pelvic glands with a relatively small primary growth (*d*) Isolated metastases in the lower part of the vagina

October 3, 1931) Mr Trumble published an account of his operation again in the *British Journal of Surgery* 1935, **23**, where he states 'The majority of the inferior splanchnic nerves and the coeliac root of the inferior mesenteric ganglion are divided near the origin of the inferior mesenteric artery from the aorta"

Professor Learmonth attributes to Mitchell (1935) the discovery of the supply of parasympathetic fibres from the sacral outflow to the upper part of the distal colon, a fact which Mr Trumble had already established (*Med J Austral* August 4, 1934), and which Telford and Stopford had recognized in March, 1934, though their description was in some respects defective I trust that Professor Learmonth will not take amiss these small criticisms of his paper, but will recognize the value of Mr H C Trumble s work in any future papers he may write on the subject

Gask and Ross, in their book *Surgery of the Sympathetic Nervous System* (p 122) discussing the problem of sympathectomy of the distal colon, state that

"It might be preferable to divide their splanchnic branches on both sides and to excise the pre aortic plexus for an inch above the inferior mesenteric artery leaving the presacral nerve undisturbed This is practically the technique advocated by Trumble the only difference being that he is content to divide the lumbar splanchnic nerves just proximal to the inferior mesenteric ganglion since he believes that the pre aortic plexus takes no part in the sympathetic supply to the colon

Alfred Hospital Melbourne, Sept 24 WILLIAM JAS PENFOLD

Idiosyncrasy to Prontosil

SIR—With reference to Dr G P Humphry's letter (October 2 p 680), in some cases prontosil certainly causes pyrexia with accompanying symptoms of severe malaise, which, however, rapidly subside when the drug is stopped I have recently observed its effect in three cases of lupus erythematosus

The first was an old nurse with lupus erythematosus of the scalp associated with a mild but painful multiple arthritis After taking two tablets of prontosil thrice daily for ten days she had a shivering attack—perhaps a true rigor—and her temperature rose reaching 102 F on one occasion, she felt extremely ill and had diarrhoea The symptoms quickly abated when the prontosil was discontinued I saw her about a fortnight later and there was a remarkable improvement in the lupus erythematosus and her rheumatic pains had ceased but such a result might have followed a febrile reaction of whatever causation I suggested she should take one tablet daily, but there was an immediate recurrence of the fever and malaise

Another case was that of a lady with chronic lupus erythematosus of the nose including the vestibules associated with rheumatism of the fibrositic type She had a long history of streptococcal infections of various kinds After taking one tablet of prontosil thrice daily for about ten days she developed a high temperature (over 102° F) with severe malaise but no diarrhoea Another attempt to take the drug provoked the same symptoms I saw her this week, as in the first case there was great improvement in the lupus erythematosus and her rheumatism had entirely gone In the third case the same symptoms occurred and were followed by considerable improvement in the eruption

Whether prontosil in these cases would have proved of permanent value had it been tolerated it is impossible to say As I have said, the improvement observed was quite possibly due to the severe febrile reaction, and not to the specific action of the drug—I am etc,

London, W 1, Oct 1 H. W BARBER

Continuous Negative Pressure in Surgery

SIR,—I am very grateful to Mr J T Morrison (October 9, p 726) for his kind criticism of my paper (*Journal* September 25, p 613) Although he prefers intercostal drainage with his ingenious trocar and cannula, he admits that there may be difficulty in making certain that the eye of the drainage tube is in the pleural cavity I should think that there would be more difficulty in maintaining the end of the tube just in the pleural cavity in spite of "secundum artem" methods of fixation The internal flange of the Tudor-Edwards tube is a great help against intermittent drainage or non-drainage by slight displacement of the tube Mr Morrison advises intercostal drainage as a "first step, so I presume that he resorts to rib resection when drainage is unsatisfactory this is why many surgeons give up closed drainage instead of giving up intercostal drainage If adequate drainage is present from the beginning I believe that chronic empyema would be less frequent He does not explain why I am wrong in advising rib resection early, but I suppose the proportion of his cases recovering without rib resection is sufficient to advocate intercostal drainage as the primary measure

Mr Morrison admits that stronger suction is indicated in the "more chronic cases" I do not see any contra indication to the application of a constant negative pressure of 30 mm of mercury (the normal intrapleural pressure at the end of full inspiration) from the onset as an attempt to prevent chronic empyema arising—I am, etc

Liverpool, Oct 9 M J BENNETT-JONES

Adult Serum in Measles

SIR—Arising out of Sir Kaye Le Fleming s account of the use of adult serum in measles I wish the profession at large would take up this question, as there is no doubt in my mind that it is the only practical method we have of dealing with these outbreaks at the present time As Sir Kaye points out, I have been able to institute through the good offices of Dr R A O Brien of the Wellcome Research Laboratories an exchange method whereby the serum obtained is replaced by whole blood from suitable volunteers One must face the fact that convalescent serum, except in hospitals, is out of the question, and also for some time to come placental globulin will not be available in any considerable amount In respect of adult serum, any young adult who has had measles can provide the amount that is necessary for his own family and in each case in which it has been used to my knowledge there have been sufficient volunteers to deal with the outbreak

May I point out that during the last two outbreaks I have kept both the local hospital and the isolation hospital open The non-immune contacts are immunized and the ward carries on It is only those who have been as I have, in charge of various children s hospitals during a measles outbreak who know what a curse a case of measles used to be in the wards Now, as I have said we immunize and carry on During this last outbreak I promised the head master of one of the biggest preparatory schools on the South Coast that I would assist if they got measles during this outbreak during the last they had had five mastoids On the occurrence of the first case the thirty-seven non-immune boys were inoculated at once, thanks to Dr O Brien, and no further case occurred Shortly afterwards at Lord Mayor Treloar s Home a case of measles occurred the day after I visited there, the diagnosis being in doubt at the time of my visit

when exposed at operation may be regarded as an aneurysm When sectioned however it resembles an agglomeration of thrombosed veins The authors of this paper ask the pertinent question Whence do these tumours arise? Are they of arterial or venous origin? The appearances at operation have not been very helpful in deciding this but they have shown that there are no large communicating channels between the tumour itself and the lumen of the artery Histological examination confirms the vascular character of the tumour It consists of blood spaces and cellular elements though the individual architecture of the angio-endotheliomas is variable Some contain giant cells Lenormant and his colleagues ask whether the tumours arise from the vasa vasorum, from small collaterals of the main artery or from a venous plexus These angiomas are highly malignant both as regards local recurrence and metastatic dissemination The five patients referred to are now dead Treatment is of little avail The tumours are radio resistant and owing to the tendency to local recurrence high amputation must be done

ANOTHER TEST FOR PREGNANCY

A practical method for the accurate diagnosis of pregnancy in its earliest stages remains, in spite of the mass of brilliant research produced in recent years an unfulfilled need Of the many tests advocated not one satisfies all the desiderata of ease of application immediate result and absolute certainty while most exhibit too many fallacies to be of real practical value The Vischer-Bowman test for example has disproved its early promise for both Gladys Dodds[1] and E Wiesner[2] have shown that the percentage error both in pregnant and non-pregnant women is too great to allow of general application of the method Similarly both Gruskin's[3] intradermal protein reaction and the subcutaneous hormone test of Gilfillen[4] are equally fallacious for though both these methods are rapid and easy they may give the most equivocal results in patients with hypersensitive skins which as Greenhill says might respond to anything The better-known Aschheim-Zondek and Friedman tests are of course much more certain than these with an accuracy of approximately 97 per cent in pregnant women and 99 per cent in non pregnant. But though this standard is very high it is not high enough to eliminate all doubt in the difficult case, and there are in addition the inconveniences of sending the specimen to a laboratory and of a fairly long time interval It is in an endeavour to avoid these difficulties that Samuels[5] has introduced his spectroscopic method This depends on the variations which normally occur in the reduction time of oxyhaemoglobin at various periods of the menstrual cycle The technique is to obstruct temporarily the blood flow in the vessels in one of the interdigital webs of the hand a direct observation being made through the author's special cycloscope of the time taken for the oxyhaemoglobin in the stagnant blood to be reduced to methaemoglobin The former shows as two sharply defined dark absorption bands in the yellow green portion of the spectrum the latter as two similar but much closer bands in the same area, with the transitional appearance of a broad grey band In normal men, and in women past the menopause the reduction time is approximately 145 seconds It is, however under hormonal influence for in non pregnant women the widest variations occur during menstruation and ovulation In pregnancy this influence is apparently inactivated so that the level remains practically constant The diagnosis of pregnancy is thus made by the daily observation of the oxyhaemoglobin reduction time a more or less constant finding indicating a positive result. For this method the author claims that it is 100 per cent certain that it can be carried out by any general practitioner and that it is positive within a few days of conception If this were true the test would be ideal and would automatically replace the more complicated biological methods now in general use But there are unfortunately several obvious fallacies In the first place the examination is by no means so easy as Samuels suggests and requires a good deal of practice for a sure result to be obtained Secondly several consecutive tests must be made the average being taken as the correct figure for that particular day and the whole performance must be repeated daily for a considerable period In the third place there is no guarantee that vicarious hormonal and general disease influences will not disturb the result, and the author's recommendation that the Aschheim Zondek reaction should be used as a confirmatory routine is difficult to reconcile with his claim of absolute certainty for his own method In these circumstances it would appear necessary to defer judgement on the test until more complete and extensive trial has either eliminated or confirmed these objections

We regret to announce the death of a very old contributor to these columns Sir John William Moore the eminent Dublin physician who was twice President of the Royal College of Physicians of Ireland and for forty seven years edited the *Dublin Journal of Medical Science*

The second annual general meeting of the British Branch of the International League against Epilepsy will meet on Friday October 22 at the rooms of the Medical Society of London Chandos Street Cavendish Square Dr Wilfred Harris the president, will occupy the chair The morning session will begin at 10 a.m., and after an interval for luncheon at Pagani's Restaurant will be resumed at 2.30 p m A number of short papers will be read and among other subjects the following will be discussed the utility of medicinal treatment, the use and abuse of bromides the employment of snake venom, the value of prominal the social care of the epileptic the electro encephalogram in epileptics Speakers include Dr F R Ferguson Dr Denis Brinton Dr R H Crowley, Dr Burgess Barnett Mr Grey Walter, Dr L G Millar Page Dr T A Munro and it is hoped that a full discussion will follow the various papers as in the previous year Medical practitioners not members of the League who are interested or would like to attend the meeting, are invited to communicate with the honorary secretary, Dr Macdonald Critchley, 137, Harley Street, W 1

absence of clinical indications,' as Dr Walshe suggests, one of the patients I mention was actually admitted to hospital and reached the operation trolley before it was finally decided that the pregnancy should continue Moreover, I do *not* "frankly admit that on purely clinical grounds they were justified in refusing to induce abortion I said that no doubt they were, *departmentally*, within their rights, but that the whole history of the patient was not being sufficiently taken into account

The law may 'never hand over to us the power of life and death over our future fellow citizens —although such questions as voluntary euthanasia and sterilization are in the air—but it has handed over such power, in a modified degree, over our present fellow-citizens, and it is against the misuse of such power that my letter of protest was written Some of us have to live with our patients, year in and year out and not simply see them once in the somewhat hurried atmosphere of an out-patient department, and I think that even Dr Walshe would concede that the responsibilities of medical practice are more likely to be brought home concretely to the individual practitioner than to the specialist —I am, etc,

London W 1 Oct 4 E A Butterworth

Expulsion of Placenta in Advance of Foetus

Sir —I have read with great interest the report of the case submitted by my friend, J W Nankivell, the communication of additional examples by L Fothergill and O Donel Browne, and the response which the subject has drawn from the erudite pen of Miles Phillips I first read Dr Nankivell's memorandum upon returning home from the Liverpool Maternity Hospital, where I had just witnessed a similar occurrence—the birth of a placenta praevia in advance of the infant

The patient aged 34 years, para-2, was admitted on September 10 at term and in early labour, with a history of having lost about a pint of blood Foetal heart sounds could not be heard The placenta was just covering the internal os, and the cervix admitted two fingers with difficulty Scalp forceps was applied but it was found impossible even with hand traction completely to control the loss which occurred with each pain Two hours later after giving an intravenous gum saline, the forceps was removed, internal version performed and a leg brought down through a cervix which would just admit a hand A blood transfusion was given About an hour later just as the upper part of the thigh was appearing, the placenta was extruded through the vulva There was no bleeding Delivery was completed with assistance ten minutes later The membranes were passed on the second day of the puerperium The responsibility and treatment were equally shared with Mr C J K Hamilton, the resident obstetric surgeon, and to him the patient and myself are greatly indebted

In this instance only a few minutes elapsed between the birth of the placenta and the delivery of the infant, and the accident must be attributed, at least in part, to the preceding interventions In the case reported by Laudadio (1932) the vertex presentation was complicated by a placenta praevia, prolapse of both hands, one leg, and the cord Delivery was effected with the forceps, the complete placenta appearing in front of the head

The question of prolapse of the placenta ' (for so it is referred to in the Continental literature) has received little notice in the ordinary English textbooks German works such as those of von Jaschke and of Stoeckel, describe the condition and allude to some of its implications I confine myself here to two points First the diagnosis Though prolapse of a placenta praevia is apparently the commoner occurrence, it may also arise when the placenta is normally implanted Hogler (1931) met this complication in five out of 158 cases of accidental haemorrhage Early in 1935 I found in such a case at least half the placenta in the vagina and assumed the condition to be one of placenta praevia My first thought was to sweep the placenta away and deliver by version, but more careful investigation revealed a marked contraction ring *in advance* of the presenting part, another abnormality which I have not seen before or since A study of the specimen obtained by Caesarean hysterectomy showed that the case was one of accidental haemorrhage with the placental site wholly on the upper segment Burczak (1932) has considered the whole question very fully Among the many aetiological factors which play a part in prolapse of the normally inserted placenta shoulder presentations occupy a prominent place Possibly Dr Fothergill's case belongs to this group The membranes and their point of rupture in relation to the placenta should be studied and recorded in these unusual cases as well as the relevant clinical data

Secondly, is there still a place in the hands of the professional obstetrician for the therapeutic removal of the placenta praevia in advance of the child? Holtermann (1936) believes that in exceptional circumstances there is, and has described a case which amply supports his contention In abdominal delivery the question likewise arises When the lower segment incision directly involves placental tissue Hogler (1936) removes the placenta before the child On one occasion I have followed his practice and was able to prove that not only may it occasionally be an advantage but that it is not fraught with those alarming consequences which one is too readily inclined to imagine

The articles by Holtermann, Högler and Burczak with their useful bibliographies cover almost every aspect of this subject from the modern point of view —I am, etc,

Liverpool, Oct 7 C McIntosh Marshall.

Pubertas Praecox

Sir —In discussing his case of pubertas praecox, published in the *Journal* of September 25 (p 620) Dr Kerr very justifiably excludes an adrenal tumour because of the absence of virilism But he then proceeds to conclude that 'the most likely diagnosis in this case would be pineal syndrome due to neoplasm or hyperplasia of the pineal gland - Might I suggest that a more probable diagnosis is either an ovarian cyst, or a tumour of a granulosa-cell or a sarcomatous type? Elterich (1931) analysed twenty-five cases of female children with precocious menstruation, tumours or cysts of the ovaries were found in twenty-one Moreover, pineal tumours in children are almost invariably found in males and not females Thus McCord (1917) in an analysis of twenty five cases of pineal tumour in children found that twenty three of them were boys In fact Timme (1933) states that sexual precocity in the female has never been known to be associated with pineal tumour This statement is, however, probably too dogmatic

The only feature which suggests a diagnosis of pineal tumour is the headache This cannot be considered of very great significance, however, in view of the absence

anaesthetic in susceptible patients—for example, those who have made up their minds that they are going to be sick and those especially liable to sea sickness and other such forms Some patients never vomit whatever anaesthetic is given Apart from these extremes the incidence and amount of vomiting vary with different anaesthetics being infrequent and slight with nitrous oxide more frequent and greater in amount with chloroform, and most with ether In some instances the preliminary injection of morphine may be responsible and inquiry should be previously made as to any such susceptibility

In its milder degrees the vomiting results from the nausea associated with the elimination of the anaesthetic In the severer and the more persistent cases the toxic effects of the anaesthetic on the liver are responsible, though it is probable that these changes occur in a less degree in the milder cases as well It must be remembered that causes other than the anaesthetic may be responsible —for example manipulation of the abdominal viscera the swallowing of blood after throat and similar operations and occasionally the use of radium The possibility of intestinal obstruction and uraemia must always be kept in mind In most cases no treatment is required as the condition clears up spontaneously in a short time Treatment should be directed locally to the stomach to hastening the elimination of the anaesthetic and in severe cases to correcting the metabolic changes both those producing the vomiting and those produced by it A large drink of warm water with sodium bicarbonate should be the first thing tried, and is often all that is necessary It acts by loosening and dissolving the ether impregnated mucus and producing one copious vomit which clears out the stomach When sodium bicarbonate is not retained long enough to act properly a stomach tube should be passed and the stomach washed out with the solution Tincture of iodine in 1-minim doses hourly should be tried while half-normal saline is sometimes retained where all else fails Less vomiting will follow a deep ether anaesthetic if as little ether as possible is left in the patient at the end of the operation This can be achieved by the administration of carbon dioxide towards the end of the operation as soon as the peritoneum is closed

The metabolic changes associated with vomiting are in the direction of acidosis and result from the toxic action of anaesthetics on a damaged liver, or sometimes on an apparently normal liver if the poisoning is sufficiently intense Where the liver is known to be damaged therefore care should be taken to avoid the use of chloroform to a less extent of ether and of more than small doses of barbiturates using spinal or local anaesthesia if it is thought that general anaesthesia without these drugs would be unsatisfactory Even when the liver is apparently healthy it must be remembered that lipoid soluble anaesthetics chloroform especially can produce structural and functional changes when administered over long periods This type of vomiting known by its old name of delayed chloroform poisoning may start after an interval of a day or two during which there has been little or no vomiting These disturbances are less likely to arise in a liver well stocked with glycogen and attention should be directed to this before the operation Diabetic patients are much more sensitive to these influences and quite apart from the question of vomiting, their metabolic equilibrium may be upset by a relatively innocuous anaesthetic They must be well controlled before operation and a close watch be kept on them afterwards by blood sugar estimations if necessary insulin and glucose being given as indicated In addition while acidosis induces vomiting the vomiting if severe will increase the acidosis

The indications are to make good the fluids and chlorides lost and to supply glucose and if necessary insulin, for the control of the acidosis although insulin has probably little influence on acidosis not pancreatic in origin, at any rate in part The glucose is given as a 5 per cent solution in normal saline per rectum

Shock

This usually becomes evident while the patient is still in the theatre, and the main lines for its treatment are laid down there Warmth must be supplied, preferably by an electric cradle, but overheating (indicated by sweating) avoided and the foot of the bed should be raised on blocks to assist the cerebral circulation Saline should be given freely, intravenously if urgently needed, followed by a continuous rectal drip If the urgency is not so great a pint of saline should be run into the rectum and after an interval the continuous drip started Absorption is slower by this method, but the results are more lasting and there is less tendency to waterlogging of the tissues and oedema of the lungs Careful watch must be kept for these If a suitable donor is available in time a transfusion of 400 to 800 c cm of blood, followed by the rectal drip, is best

Other Abdominal Complications

Abdominal distension is often troublesome, and is usually the result of the handling and exposure of the viscera The anaesthetic may be partly responsible for chloroform and ether diminish intestinal movement, while in spinal anaesthesia a reactionary period of quiescence may follow the wearing off of the anaesthetic It is relieved in most cases by the passage of a flatus tube or a large rubber catheter through the internal sphincter or if this is unsuccessful by a soap enema with half an ounce of turpentine to the pint The aperient will make the patient feel much more comfortable He should assist by changing his position frequently and contracting and massaging his abdominal muscles if this is not too painful The distension may be a sign of peritonitis or intestinal obstruction, and diagnosis in these circumstances is difficult

Acute dilatation of the stomach is a rare but very serious complication Here the stomach is completely atonic with frequent and copious vomiting and the patient in a very shocked state Keeping the stomach empty by aspiration through a stomach tube and treatment on the lines of toxic vomiting, should be tried but the condition is usually fatal

Hiccup may be troublesome but it usually yields to the administration of carbon dioxide sufficient to produce deep respiration for several minutes It may return but it can be treated any number of times in this way It is extremely wearing and where all else fails needs treating by morphine or by crushing of the phrenic nerve

Retention of urine may follow any operation but it happens most commonly after abdominal and pelvic operations and is more likely after spinal than after general anaesthesia The patient must be assured that there is no cause for alarm as this aggravates the condition The unaccustomed position in bed may be all that is wrong and if the patient is allowed to sit on the edge of the bed micturition may result A hot bath when possible or a hot enema is usually successful If there is no result 10 grains of hexamine in a cachet should be prescribed and repeated in half an hour if necessary Only if these remedies fail should catheterization be done as if once started it may have to be repeated for several

In the two cases which I reported in the *Journal* in 1931, associated respectively with tuberculous meningitis and a mammary tuberculoma, the same sequence was observed It seems to me remarkable that the effect should disappear before the cause In the same report I included the case of a married woman whom I had attended during two attacks of erythema nodosum, each associated with follicular tonsillitis In this instance the patient recovered from the tonsillitis before the erythema disappeared Early this year I had under my care a young lady who developed erythema nodosum somewhat late in the course of an unusual pulmonary infection Dr Lionel Whitby, who examined the sputum, found streptococci with pneumococci, and *M catarrhalis* but no tubercle bacilli At no time did the illness suggest a tuberculous condition, and when later Dr Bellamy made an x-ray examination the films showed only a lower lobe bronchopneumonia Moreover, the patient has remained perfectly well since her recovery

Dr Philip Graves has now reported a minor epidemic of five more cases of erythema nodosum following tonsillitis In his cases, as in mine, the presumed cause and effect subsided in the right order If it is agreed that the streptococcus can enter the blood stream without obvious lesion in the throat or intestine, then it seems most probable that every case of erythema nodosum is really streptococcal in origin, but that the condition occurs sufficiently often for it to coincide sometimes with other infections—I am, etc,

Cataract Extraction

Sir,—The publication in the *Journal* of August 14 (p 319) of an article by Mr Basil Graves describing a new method of narcosis in cataract operations and the subsequent correspondence have led me to give a short description of a method which we have employed for a considerable time in cataract extractions in a mental hospital where Miss Ida Mann is the visiting consultant Mental patients are notoriously difficult to deal with, both at operation and subsequently, and it became necessary to adopt some reliable sedative measure while at the same time retaining as much co operation as possible

Paraldehyde given by the mouth, usually in doses of 2 drachms, was found ideal for this purpose, and in spite of statements to the contrary is not too unpleasant The patient is prepared in the usual way, and about half an hour before being taken to the theatre is given 2 drachms of paraldehyde in 1 oz of water This is sufficient to induce a state of mild drowsiness which deepens during the hours following the operation This usually takes place in the early afternoon, and a second dose of the same strength is often necessary later the same evening, and this usually maintains quietude during the night Further administration varies with the individual, but similar doses once or twice daily may be given as freely as necessary The method is both simple and safe, and renders the use of morphine or its derivatives superfluous

The operative results have been excellent Excitement and trepidation are allayed, and a fair degree of co-operation is retained There is complete lack of post-operative restlessness and vomiting and we have never had a case of prolapsed iris An interesting final point is that the acute maniacal symptoms which often follow cataract operations in the sane have been entirely absent in these psychotic patients—I am, etc,

Post-mortem Examinations in Inquest Cases

Sir,—I have read with interest Dr L F Beccle's letter (*Journal*, October 2, p 684) suggesting that doctors should refuse to give opinions on inquest cases when in doubt as to the cause of death An experience of mine showing the consequences of following this advice may be of interest in this connexion

While acting as locumtenent in a small provincial hospital three years ago I admitted a girl, aged 4, who had been run over by a municipal refuse cart The child was *in extremis* and died fifteen minutes after admission, the only external sign of injury being a small bruise on the chest wall I communicated with the coroner's officer and asked for permission to make a post-mortem examination Later in the day the coroner's officer called to see me, and, saying that the coroner was very averse to necropsies, tried to persuade me to say that the child had died from a fractured skull This I refused to do, and replied that I could not give an opinion as to the cause of death without a post-mortem examination After some argument the coroner's officer left the hospital, and an hour or so later telephoned to say that the coroner had given permission for a necropsy At the necropsy I found that the child had died from a ruptured liver, the abdomen being full of blood There were no other injuries

At the inquest I was publicly rebuked by the coroner who implied that I was indulging a morbid taste by insisting on a post-mortem examination, and reproved me for "wasting the ratepayers money" As I was only in the town for a fortnight the coroner's remarks did not affect me, but it is easy to understand that such remarks published in the Press would be prejudicial to the practice of a doctor permanently residing in that locality, and in the face of such criticism considerable courage is required to pursue the right course I am in entire agreement with Mr Brooke's suggestion (September 25, p 639) that post-mortem examinations should be compulsory in all inquest cases—I am, etc,

Hull, Oct 4 Iris M Cullum

International Postgraduate Congress

Sir—Professor Henry Cohen has struck a timely note Until Germany mends her ways in the treatment of our professional brethren we must be wary One's friends are inclined to say we doctors must not meddle in 'politics," but when some of the best men in Germany are thrown out of their positions for no reason other than religious or racial principles, when the question of merit does not apply, then a resolution fostered in Berlin to further international *fellowship* and *friendship* ' must be viewed with suspicion—I am etc,

Dublin, Oct 5 Bethel Solomons

Nutrition in the Falklands

Sir—The indifferent milk yield, poor soil, and ill health of man and beast said to prevail in the Falklands tempt one to look for some common factor Sir John Orr is reported to have described the soil as acid, with a high nitrogen content which is not utilizable Reading this, the temptation to the amateur gardener to think of absence or scarcity of lime in a proper form is irresistible I would suggest that the absence or scarcity of calcium in a suitable form may be the initial factor causing a whole sequence of troubles If my surmise is correct the remedy is lime on the pastures, and lime and good husbandry in the gardens—I am, etc,

Shrewsbury Oct 9 Albert E Nicholls

and games to face the needle Reactions were moderate, with a rise of temperature and malaise for twenty-four hours A few severe reactors were admitted to the hospital tent but there were no septic arms A week later a second double strength dose was given checked by a card index system, and by this time the camp was exceedingly typhoid conscious Preparations were made in local fever hospitals for large numbers of patients, but no more cases occurred Two cases were admitted with non lactose fermenting stools, but these proved not to be enteric

It is interesting clinically to note that all the typhoid cases suffered from roundworms The onset of enteric was sudden, with pyrexia and loose stools and the Widal reaction was positive to a dilution of 1 in 250 on the same day All five patients were extremely ill, but recovered under the kindly care of Dr Thompson of the Southampton Fever Hospital

Summary

For the following reasons conditions were ideal for the spread of typhoid fever

1 All the children were under nourished and many were suffering from vitamin-deficiency diseases They had lived for three months on a diet of rice and beans

2 The camp was overcrowded Efforts were made to space out the numbers in the bell tents but families and friends often crowded together when night had fallen It was quite a common thing to find some tents with two or three inmates and others with sixteen and eighteen

3 For the first two weeks sanitary conditions were appalling During the Spanish War the children had lost all hygienic control Faeces urine and garbage were deposited in and around the tents hedges and ditches

4 Typhoid contacts sent to the isolation camp resented their imprisonment Their small friends dodged the guards to visit them

The incidence of typhoid fever is not high in the Basque Province and there is no reason to suppose that they had developed an immunity Sufficient time has elapsed for it to be stated that no cases have occurred except the five diagnosed It is therefore claimed that mass inoculation prevented a typhoid epidemic The Basque children are now widely scattered over England, Scotland and Wales and the main North Stoneham Camp is closed The foregoing description of the typhoid outbreak is only a fraction of the routine medical work carried on there It might be necessary in the future to care for our own children in emergency conditions of war when the experience gained from these unfortunate refugees would be most valuable

Altogether about 7000 children have been evacuated to France Belgium Russia and Mexico It will be of great interest to compare notes of the incidence and treatment of infectious diseases from our medical colleagues of those countries when they become available

I would like to express my thanks for the excellent team work of the medical staff trained nurses and the V.A.D.s to Dr Cronk of Winchester and Dr Maurice Williams of Southampton for arranging the pathological investigations to Dr Garrett and his sanitary staff of Eastleigh and to the St John Ambulance Brigade of Eastleigh

In the reports of the administration of the Stockholm hospitals just published reference is made to the constantly increasing use of blood transfusions A blood donors register was established in 1934 and the persons listed there, who are periodically examined have been called on in ever increasing degree since then Last year the number of transfusions from these persons was 672

THE GENERAL PRACTITIONER AND PREVENTIVE MEDICINE

ADDRESS BY SIR KAYE LE FLEMING

The subject for discussion at the tenth annual Health Education Conference held at the London School of Hygiene and Tropical Medicine on October 1 was 'Health Education and the General Practitioner' The following is an abstract of the opening address by Sir Kaye Le Fleming M D Chairman of Council British Medical Association

Machinery of the Health Services

I am going to put before you quite shortly, the views that I think are held by a very large number of general practitioners on the subject which I have to open, which I think might as well be phrased as the position of the general practitioner in preventive medicine' because public education in health matters is one of the most important aspects of preventive medicine

Before discussing the position I would ask you to consider the machinery by which the great health services of this country are run The Minister of Health devises legislation which is put before Parliament, and we do not think perhaps from the point of view of the doctor, that Parliament is particularly well educated in medical matters But in our democratic machinery health legislation is evolved at the centre

The next step is to pass on the machinery to the local health authorities Local health authorities sound a very important bit of machinery but I am not sure that by taking a collection of individuals and calling them a local health authority you can make them authorities in health matters One of the inevitable sacrifices that we must make in the cause of democracy is to have popularly elected bodies dealing with highly technical subjects Local health authorities are as a rule very good administrators who putting it quite baldly know very little about health matters The Ministry recognizes this and in order to help them they are supplied with a medical officer of health He is the direct link between the central health administration and the local health authority, and a very important link indeed In my view he lacks that measure of independence that he deserves He must advise his local health authority and if he is to do his duty well he must at times give them advice that they do not like and if the local authority can entirely disregard his advice such an arrangement cannot be in the best interests of the public health

Contact with the Homes of the People

The machinery is a central machinery and lacks contact with the homes of the people How is the health education to reach the homes of the people? One thinks first of all of the Press I am not concerned to discuss to-day that factor in health education but it is a great misfortune and one which I hope will be remedied that the Press should not have ready access to the best considered opinion of the medical profession The other great factors of course in reaching the homes of the people are doctors and nurses Let me deal with the doctor I would be the first to admit and deplore the fact that the education of the doctor in preventive medicine is wholly insufficient

The respect paid to preventive medicine in health education to-day is lip service only The unfortunate student has to pass examinations He is taught and he is examined by specialists who are extremely adept at their job and he is taught to diagnose and treat disease His sole object is to get through examinations Speaking generally neither his teachers nor his examiners have any close acquaintance with the machinery of public health

institute for the production of a cattle plague serum, and Sir Horace Pinching director-general of the Cairo sanitary service, testified to the splendid work which he then did in the face of countless difficulties For this and other work he received the orders of the Osmanieh and the Medjidieh

At the Queen s College in Belfast Professor Symmers had duties to perform that anyone less versatile would have found difficult Not only did he give instruction to medical students in pathology and bacteriology but also in medical jurisprudence, while he was pathologist to two large general hospitals, the Royal Victoria and the Mater Infirmorum, and to several special hospitals As a witness for the Crown in criminal cases Professor Symmers was unsurpassed his answers to counsel were always direct and explicit, and he never was flurried no matter how severe the cross-examination With the establishment of Queen s University, Belfast, in 1908, Professor Symmers brought to the medical faculty a knowledge of academic procedure and of affairs blended with a sane and mellow wisdom, which proved most useful to the new University For many years as dean of the faculty he presided at its meetings, and under his chairmanship business was conducted with dignity and dispatch In addition to his academic work, Professor Symmers was for many years bacteriologist and pathologist to the city of Belfast

It was perhaps as an after-dinner speaker and raconteur that Symmers will be remembered by the public of Belfast He had a tendency at medical dinners to indulge in gentle raillery at the expense of some of his colleagues, but his humour was without malice In the midst of his numerous tasks Symmers found time for research, and was a most inspiring chief for his young assistants He contributed many papers to scientific journals, more especially to the *Journal of Pathology* the *Journal of Hygiene* and the *British Medical Journal* His best-known work was on bilharziasis, and on the pathology and bacteriology of cerebrospinal fever

Not only in Belfast but in Southern Ireland was Symmers warmly welcomed and entertained At Trinity College, Dublin, and at the constituent colleges of the National University in Dublin, Cork and Galway, where he acted as extern examiner, his colleagues enjoyed his visits and the candidates found him fair with mercy tempering justice As a lecturer at Queen s University he was not only respected but beloved by his students, who soon discovered that in him they had not only a teacher but a friend In the medical profession Professor Symmers took a great interest, and was elected President, and later an honorary Fellow, of the Ulster Medical Society He became a member of the British Medical Association in 1905, being secretary of the Section of Pathology in 1907 at Exeter, and President of the same section in 1909 at Belfast

W J W

We regret to record the death on September 18 of Dr James Macpherson Lawrie the founder of the Weymouth and District Nursing Hospital, Dorset, at the age of 81 After graduating M B of Glasgow University in 1881 he held the appointments of house-physician and house surgeon at the Western Infirmary Glasgow, and he had also been house-physician at the Royal Infirmary He proceeded M.D in 1884 Dr Lawrie went to Weymouth in 1883 and was at first associated with the late Dr William Smith at the old Weymouth Sanatorium of which he took charge two years later From the start of his medical career he had devoted special interest to gynaecology while conducting a large general medical practice and he realized quickly the inadequacy in all respects of the old sanatorium which had been built in 1848 and was serving the whole county He set himself, therefore, to the task of collecting money for the establishment of a larger and much more up to-date building, and the financial success of the undertaking was eventually secured without interfering with the original endowment fund, £17,000 being collected in a few years In 1901 the foundation stone of the new building was laid, in 1903 the patients were admitted, and in 1904 all the cost had been met An annexe for paying patients was added In 1921 Dr Lawrie saw the Princess Christian Hospital absorb the old Weymouth Royal Hospital, which had been founded in 1816 as the Weymouth Dispensary, the amalgamated institutions being subsequently known as the Weymouth and District Hospital Soon afterwards Dr Lawrie gave up practice in the town and removed to London, but he returned in 1924 to receive the freedom of the borough for his outstanding services to it in many ways He was appointed a county magistrate in 1889, a member of the first Dorset County Council in 1892, and a Deputy Lieutenant in 1906 He was chairman of the Portland county bench for twenty years, and president of the Melcombe Regis Conservative Association for a quarter of a century He was for many years a member of the British Medical Association, and in 1906 was president of the Dorset and West Hants Branch His wife gave him devoted help in his work, and organized and equipped four Red Cross hospitals in the war, she died a few years ago Dr Lawrie had also commanded the field ambulance which was equipped at Weymouth, and superintended the organization of the Volunteer Transport Corps A fluent and convincing speaker, his public influence was very great, and he will long be remembered by large numbers of grateful patients as well as by his colleagues He was a highly skilled and experienced surgeon

Universities and Colleges

UNIVERSITY OF OXFORD

The following have been elected to professorial fellowships at Balliol College Professor J A Gunn M D director of the Nuffield Institute of Medical Research Professor J H Burn M D who succeeds Professor Gunn in the chair of pharmacology and Professor Simon Flexner M D George Eastman visiting professor

UNIVERSITY OF CAMBRIDGE

During the months of August and September titles of medical degrees were conferred by diploma on the following members of Girton College

UNIVERSITY OF LONDON

Lectures

A course of five Heath Clark Lectures on 'The Natural History of Population' will be given by Professor Raymond Pearl professor of biology in the Johns Hopkins University School of Hygiene and Public Health Baltimore at the London School of Hygiene and Tropical Medicine Gower Street W C on October 27 and 28, and November 1, 3, and 4, at 5 30 p m

The Semon Lecture on The Surgical Treatment of Chronic Cicatricial Stenosis of the Larynx will be given by Dr E Schiegelow emeritus professor of oto laryngology in the University of Copenhagen at the Royal Society of Medicine 1, Wimpole Street W on Thursday November 4 at 5 p m

A course of three lectures on Innervation Problems in the Sympathetic System will be given by Dr J Boeke professor of histology and embryology in the University of Utrecht at St Thomas s Hospital Medical School on November 1 3 and 4 at 5 30 p m

A course of three lectures on Human Pseudo tuberculosis will be given by Dr I Snapper professor of general pathology in the University of Amsterdam, at Middlesex Hospital Medical School on November 9 11 and 12 at 5 30 p m

A course of three lectures on Experience and Perception Thinking Feeling will be given by Professor Edgar Rubin,

a scheme to furnish the Health Department with reliable vital statistics, provision was being made for new tuberculosis hospitals at Durban Port Elizabeth Lovedale and Umtata, as well as large extensions of existing institutions Though these schemes would cost millions the medical profession should urge most strongly that funds for this purpose should on no account be stinted, and he trusted that the public would strongly support the doctors in this matter

Dr de Kock reminded his audience that a recent Government Commission had estimated that there was a shortage of some 5,000 beds for mental treatment This deplorable state of affairs was to be attributed to the fact that in the highly technical problem of the care of the insane the last word lay with men who possessed no qualifications whatever to enable them to get a correct perspective of the problem Mental health was as much a part of public health as was plague, leprosy or typhoid fever, it was an integral part of the problem of conservation of human power, efficiency, and life

What is Wrong with the G P ?

The public lecture, which has become a feature of the Congress was delivered in Afrikaans by Dr C P Theron, who pleaded for a reorientation of the general practitioner and vigorously criticized the self-styled specialist He commented on the public s loss of faith in the general practitioner and emphasized that the general practitioner must regain that place of confidence in the lives of his patients where they would trust him as their help and adviser in hours of need Until the general practitioner occupied his rightful place in society harm would continue to be done and both the public and the medical profession would suffer

Well-equipped hospitals were now the order of the day, and everywhere were specialists waiting to treat a patient s ailments or relieve him of redundant organs The doctor was no longer allowed to dispense his own medicines there were pharmacists to do the work The result was that the general practitioner found himself an interested spectator between the specialist on the one hand and the pharmacist on the other Wherever the general practitioner looked to day he was up against the specialist Woe to the doctor who ascribed palpitations and a feeling of suffocation to indigestible food and did not send the patient at once to a heart specialist! Or woe to the doctor who did not summarily dispatch every case of colic caused by green apples and buttermilk to the stomach specialist as one of probable gastric ulcer gall stones appendicitis twisted bowel or internal piles! And so on right through the whole gamut of ailments of the human body

The worst feature of all was the way in which the general practitioner had had to give way step by step to the specialist until he arrived where he was to-day in the opinion of the public in the opinion of specialists and also in his own opinion—a solitary road sign pointing to the wisdom in others Whereas formerly the public estimate and expectations of the general practitioner inspired him with high ideals and a determination to attain to those ideals that same public estimate now had an opposite effect and there arose in the newly qualified and even in the older doctors an inferiority complex which had a paralysing and slackening influence on professional life The frequency with which the general practitioner sent patients to specialists was clear proof of a growing inferiority complex and a loss of faith in his own ability

Plenary Sessions

The plenary session next morning dealt with specialism and team work and Dr Theron came in for some criticism for having vented in public a matter which some members considered should have been thrashed out in the privacy of a purely professional gathering The particular point to which exception was taken was the reference in Dr Theron s lecture to the self styled specialist The subject for this the first plenary session was introduced by four papers The first paper which discussed specialism and team work from the public s point of view, had been written by Dr Andrew Watt to whose lamented death the President had already referred The remaining three papers were read by their authors Dr C J Albertyn dealt with the subject from the general practitioner s point of view Dr Nesbitt from the specialist s point of view and Dr Lewis Robertson from the hospital s point of view The first half of two mornings were allotted to this discussion

The other subject dealt with in plenary session was Modern Therapeutics The Wheat and the Chaff This too occupied two half mornings 9 to 11 a m the period between breakfast and that morning tea to which South Africans as a nation are addicted Again the subject was introduced by four papers Professor Falconer (who was being congratulated on his recently announced appointment as Principal of the University of Capetown) discussed the medical specialist s point of view Professor J M Watt the pharmacologist s Dr C H H Coetzee the general practitioner s, and Dr E B Woolff the physiotherapist s

Sectional Meetings

Each day after morning tea there were meetings of the five constituent sections—medicine, surgery gynaecology and obstetrics, public health and special subjects—in which a great variety of subjects were covered The section of medicine presided over by Dr E G Dru Drury of Grahamstown had for its opening paper one by Professor Crumb of Johannesburg on glycosuria Interesting papers in this section were those by colleagues from Mozambique Dr Aurelio de Castro Galhardo of Lourenco Marques Hospital dealt with hypochloraemia Mr Besselaar of Pretoria presided over the surgery section Here the opening paper, on acute abdominal pain in children was by Mr Lindsay Sandes, the discussion on the subject being opened by Dr Sanders of Pretoria In this section too there was a paper by a Portuguese colleague The high standard of the contributions by these guests from Lourenco Marques gives promise of a very successful function next year—in September, 1938 when the thirty second South African Congress is to be held in that city The opening paper in the section of gynaecology and obstetrics under the presidency of Dr J Black of Johannesburg was by Dr D J Malan (Durban) on some obstetrical matters relating to recent advances in asepsis The hygienists under Sir Edward Thornton dealt first with the unholy triad Malnutrition Tuberculosis and Venereal Disease introduced by Dr P W Laidler

Federal Council and Groups

Time was also found for the meetings of subsidiary groups such as the Railway Medical Officers group the Radiological Society of South Africa the Ophthalmic Society of South Africa the South African Society of Medical Officers of Health District Surgeons group and the Neuro Psychiatric Society of South Africa The Federal Council had a heavy programme to work through perhaps the most interesting item being the question of the establishment of a third medical faculty in the Union in which teaching was to be carried out in Afrikaans After a lengthy discussion the following resolutions were passed

1 That the Federal Council is in agreement with the principle that Afrikaans tudents are entitled to receive their medical instruction in the Afrikaans medium

2 Subject to the proviso that the Government satisfies itself that there is a sufficient number of students who would avail themselves of this facility the Federal Council is in favour of the establishment of a third medical faculty with the medium of Afrikaans in Pretoria

The sixth annual report of the National Birth Control Association, with which is incorporated the Birth Control Investigation Committee, covers the year 1935–6 It records that out of 423 maternity and child welfare authorities in England and Wales 196 have now taken some steps under the Ministry of Health memoranda on birth control During the year under review eighteen new clinics were established, and twenty-three more authorities decided to refer cases to clinics or doctors in private practice three made grants, and three lent or hired premises to voluntary clinics The branches of the Association increased from twenty-nine to forty-three, two of the new clinics being in the Special Areas Conferences were held in Glasgow, Birmingham, and Newcastle-on-Tyne, and the medical subcommittee met at Oxford

The October issue of *The Human Factor*, price 2s 6d, published by the National Institute of Industrial Psychology (Aldwych House, W C 2), contains an editorial on vocational education and guidance in India, which brings out some of the main aspects of the reforms that have recently been suggested, and an article by Dr F W W Griffin, who discusses the underlying psychological principles upon which training for the Scout movement is based

QUERIES AND ANSWERS

Broken Sleep

"Argyleshire writes A busy professional man of 56 has got into the bad habit of early waking Sleep is good from about 11 p m till 3 or 4 a m Thereafter it is broken or absent All the usual things have been tried without effect, alkalis food a hot drink getting up and walking about reading Is it wise to prescribe a sedative regularly, and what should be given? The man gets heavy and weary in the day, and can sleep a little in the afternoon if he gets the chance Is it found that the giving of a sedative over a period induces a better sleep habit or is the condition as bad as ever or worse when the sedative is dropped?

Shadows Under the Eyes

'Aesthetic writes I would be grateful for any suggestions for getting rid of black shadows under the eyes The patient is a young woman recovering from a bad general breakdown The shadows vary in intensity getting paler after a good night's rest The patient has often been accused of putting on the black but it will not wash off though it comes out with the tears I have observed her very closely for years and have never seen any proof of external stain The eyelashes and the margin of the lid are not involved in the shadow, nor does it appear on the upper lid

Spinal Anaesthesia

Dr S W Sutton (Camberley) writes I notice that in his very instructive article in the *Journal* of October 2 Dr H K Ashworth makes no mention of novocain except for raising a preliminary skin wheal I would like to ask How does novocain as a spinal anaesthetic compare with stovaine or percaine?

*** We have submitted the above inquiry to Dr Ashworth who replies I have no personal experience of the use of novocain crystals dissolved in cerebrospinal fluid but I have many times administered proprietary preparations of novocain and have not found any as effective or controllable as either stovaine or percaine The chief comparative differences between novocain and stovaine and percaine are as follows Novocain is the weakest drug and is therefore effective only in a greater minimal concentration which necessitates the use of a comparatively concentrated solution This results in some loss of control lability of the level of anaesthesia obtained Stovaine (Barker's 10 per cent solution) is also fairly concentrated, but the more powerful drug appears clinically to have a greater selective affinity for nerve roots with the result that it is rapidly 'fixed and easily controllable Briefly stovaine and percaine solutions when administered by a correct technique are more easily controllable and freer from any tendency towards upward extension of the anaesthesia above the desired level The development of anaesthesia following the use of novocain solutions is slower than with stovaine but quicker than with percaine The resulting anaesthesia lasts longer than with stovaine but is of shorter duration than with percaine

LETTERS, NOTES, ETC.

Medical Peace Campaign

Dr Stella Churchill honorary secretary Medical Peace Campaign (8 Cumberland Terrace N W 1) writes The first national congress of the International Peace Campaign will be held in London from October 22 to 24 A medical commission has been arranged under the auspices of the Medical Peace Campaign and the following subjects have been put down for discussion (1) To consider the prevention of war in all countries by medical international action (2) to discuss the attitude of the medical profession towards all State regulations affecting war It is hoped that readers of the *Journal* may feel sufficiently interested to come and express their opinions at the meeting which will be held from 2 p m to 6 p m on Saturday October 23, at University College

Medical Golf

The autumn meeting of the Shropshire Medical Golf Association was held at Church Stretton on October 3 in glorious weather The competitions were a medal round in the morning for the captain's prize presented by Dr A V Mackenzie (Shrewsbury) This resulted in a tie Dr A V Mackenzie 76 – 7 = 69 Dr H G Beckett, 82 – 13 = 69 Dr E C Abraham 82 – 9 = 73, Lieut.-Colonel H Burney 85 – 12 = 73 As Dr Mackenzie was the donor Dr Beckett received the prize consisting of some cut glass tumblers By a strange coincidence when Dr Beckett was captain Dr Mackenzie tied with him for first prize and received from Dr Beckett some cut glass decanters In the afternoon the competition was foursomes v bogey Dr Barry and Dr Clarke = 2 down Dr Beckett and Lieut.-Colonel Burney = 3 down Dr Abraham and Mr Haydon = 3 down Mr L J Godson was elected captain for the ensuing year and Dr T R Elliott was re-elected honorary secretary The spring meeting was fixed for the second Sunday in May at Oswestry Golf Club

Sodden Leaves on Roads

The Automobile Association again issues its annual warning to motorists to beware of skidding on roads affected by rain sodden leaves and emphasizes the necessity for care particularly after dark in wooded areas As a precaution the A A recommends the maintenance of uniform tyre pressures whilst correct brake adjustment is also a valuable safeguard

Disclaimer

Mr H Harvey Evers F R C S of Newcastle upon Tyne wishes to disclaim responsibility for the unauthorized reports which have appeared in the Press about his "new private hospital

difficult to ensure the exposure to radiation of a growth which might descend as far as the inside of the cricoid cartilage or even lower An unsuspected extension to the opposite side might escape treatment by radiation and this helped to explain some of the failures met with after this form of treatment A study of such cases helped also to explain the failures which sometimes occurred with intrinsic cases not carefully selected for removal by the laryngofissure route If this route were limited to intrinsic cancer of a mobile cord, with both extremities free of the disease a lasting cure should be obtained in all cases and without an operative death In cases where the subglottic growth had passed to the other side, or invaded the commissure, or reached the arytenoid or completely invaded and fixed the whole cord, a total laryngectomy was the surest procedure

The last part of Sir StClair Thomson's address was a description of the illness of the Kaiser Frederick He mentioned that Mr Lionel Colledge,[1] after a careful consideration of the various reports of the case, came to the conclusion that the disease was a subglottic cancer, below the left cord with a small extension upwards in the region of the vocal process

COLOUR IN CAR HEADLIGHTS

It is alleged by some that if the headlights of motor cars emitted coloured light instead of white driving at night would be easier and safer Further it is said that objects illuminated by coloured light are seen better, and that the light is less dazzling Such claims as these, if they were substantiated would make coloured lights a boon In France the legislature was persuaded that these claims were sufficiently justified to warrant the compulsory use of yellow lights

The B M A's Comment on Yellow Lights

When this action was reported the British Government asked the British Medical Association for its comments upon the problem The special committee that was appointed by the Association reported thus

It appears to the B M A Committee that the Paris Committee has made extravagant claims for the superiority of yellow headlights over the ordinary white variety With the possible exception of an improvement in visual acuity for very small objects previous research work shows that yellow illumination is not superior to white illumination of equal candle power Under the conditions of illumination on roads at night the acuteness of vision for small objects probably plays a relatively small part in the whole visual picture Yellow illumination must be definitely inferior to white in the recognition of objects by their colour The fact remains that many drivers do prefer a yellow light apart from the lower intensity of illumination These preferences are probably psychological"

Inquiry by a Special Committee

The Department of Scientific and Industrial Research has now gone further in the question[2] Through a committee it has examined the material at the disposal of the British Medical Association and some later research It propounded four questions and gives the answers thereto with the experimental data upon which these replies were formulated

The questions are

(*a*) Can a driver of a car at night see better if he uses headlight emitting coloured light?

(*b*) Is the disturbance of a driver's vision by the headlights of other cars reduced if they use coloured light?

(*c*) Can a driver see objects at a greater distance in mist or fog if he uses headlights emitting coloured light?

(*d*) Can the occurrence of coloured objects and backgrounds be turned to advantage by using headlights emitting coloured light?

After considering these questions in detail and setting out all the known facts at length the committee arrived at a general answer to the whole inquiry That summary is the one which will be of most interest and assistance to car drivers

None of the claims made in favour of using a coloured and in particular a yellow headlight beam rather than a white beam of no greater power has been substantiated The claim for a greater range of visibility in fog may be regarded as definitely disproved On the other claims for less dazzle and greater facility of vision the evidence is inconclusive but it is apparent from the information at present available that further work is unlikely to show that any considerable advantage can be secured by using coloured light

The Flat Beam Lamp

To doctors the fog lamp is necessarily a matter of great interest They must be out in all weathers and in the winter may easily be caught in a fog As has been pointed out in the columns of the *Journal* at earlier dates the best way of meeting the difficulty is to secure a lamp which will project a flat beam parallel with the ground and as low down as possible The fog is nearly always thinnest near the ground A flat beam reduces the dispersion of the rays so confusing with the usual headlights The fact that this type of lamp is becoming a standard attachment to many cars of recent issue is sufficient evidence of its appreciation by drivers The comfort of a properly fitted light of this type is little short of amazing

The dazzle problem in ordinary night driving has been dealt with by the British authorities With a properly adjusted mechanism which will extinguish the off side headlamp and dip the near side lamp there is no dazzle And withal the driver can drive safely in the broad beam of light projected along his near side

AN AWARD FOR GALLANTRY

The King has awarded the Edward Medal to Robert Benjamin Saunders M B Ch B in recognition of his gallantry in the following circumstances recorded in the *London Gazette*

On January 4 1937 an accident occurred in the Tebekwe Mine Salisbury Southern Rhodesia in which a miner named Sheasby was trapped underground by a fall of rock and completely buried Dr Saunders arrived at 3.15 p.m. by which time the rescue party had removed most of the spillage from the imprisoned man's body His left hand however was firmly held between two timbers He remained in this dangerous position until 12.30 p.m. the next day During the whole of this time (with the exception of a short interval when he went to the surface for some food) Dr Saunders remained underground rendering every medical assistance under extremely difficult and dangerous conditions In order to attend to his patient at all the doctor had to lie on top of him with his back in close proximity to a dangerously shaky roof any disturbance of which would have resulted in a fall sufficient to crush them both After sixteen hours when all efforts to extricate the miner had failed it was decided to amputate his arm The conditions only allowed of left handed work and the operation was therefore performed by a left handed amputator under the supervision of Dr Saunders Sheasby was then transported to the surface and he has now completely recovered from the effects of his long ordeal

Dr Saunders displayed great devotion to duty in circumstances of grave danger and his example undoubtedly inspired the injured man with fortitude and the rescuers with courage and determination

The Use of Coloured Lights in Motor Car Headlights. Illumination Research Technical Paper No. 20. London: H.M. Stationery Office. 1937. Pp. 52. (9d.)

atonic dilated colon There were two deaths in the series Excellent results were obtained in those cases in which the descending colon and sigmoid were involved, whereas in those in which the disease included the left half of the transverse colon the results were not quite so good Results in six cases of atonic megacolon treated by a limited operation were unsatisfactory, but in two cases in which an extensive sympathectomy was carried out cure was achieved

300 Metacarpal Fracture from Ski-ing

According to D Logròscino (*Chir Organi Mov* March, 1937, p 479) spiral fracture of a metacarpal bone or bones is much more common in ski-ing accidents than in boxing hockey, or sleighing , in ski-ing it is the next most common injury to the upper limb after shoulder fractures and is more common than elbow injuries Twelve recent cases are illustrated The site of the fracture is usually between the proximal and middle thirds, but in cases in which one bone only is broken it is usually the fourth metacarpal, and when several are fractured the fourth is commonly included The spiral line of fracture is always directed from ulna to radius When the thumb metacarpal is broken the lesion is characteristic and affects the base near the metacarpal-joint in the form of Bennett s fracture The accident is preceded by a fall and the hand held with the dorsum forward to protect the face strikes the ground before there has been time to open the fist and cease to grip the 'bastoncino which is strapped to the wrist The deformity is slight, reduction is easy, and plaster or other fixation is only required for three weeks or so

Therapeutics

301 Painful Scars

A Pozzan (*Arch ital Chir* 1937, **46**, 1, p 1), who records eight illustrative cases in patients aged from 26 to 46, has successfully adopted Leriche s method for the treatment of painful scars and amputation stumps It consists in infiltration of the scar and neighbouring parts with a 1 per cent solution of novocain Five or six infiltrations with one or two days' interval between each should be carried out even if the pain has diminished or entirely ceased after the first few injections No ill effects were observed in any case

302 Male Hormones

W Stemmer (*Münch med Wschr* July 30, 1937, p 1205) believes that the male semen absorbed in the female genital organs exercises an important influence on the general female constitution He was able to observe that hypoplastic genitalia in women developed rapidly following regular sexual intercourse He also found that certain nervous disorders and hormonal disturbances in women were greatly improved after certain contraceptive measures, such as the use of rubber sheaths, immediate douching etc , were discontinued In a number of cases the administration of male hormones had a favourable influence on general debility and on depression in cases of elderly spinsters and in women who were practising birth control

303 Diathermy in Hepatic Cirrhosis

F Formigal Luzes (*J Radiol Électrol* , July, 1937, p 298) recommends diathermy treatment in cirrhosis of the liver particularly in the hypertrophic form with ascites He describes his technique in which he applies one indifferent electrode 30 by 40 cm to the back and an active electrode 20 by 30 cm to the region of the liver giving 500 to 3 000 milliamperes in daily applications of from twenty to thirty minutes' duration at fifteen to twenty-four sittings In the cases observed by the author and in those reported by other workers the ascites and oedema rapidly subsided, while the general condition of the patients improved at the same time

Anaesthesia

304 Sodium Evipan Anaesthesia

H Eltorm (*Ugeskr Laeg* July 15, 1937, p 757) reports from a Danish hospital his experiences since the spring of 1935 with sodium evipan narcosis induced in 450 patients for every variety of operation from dental extractions to the most extensive laparotomies In about twenty cases the narcosis was more or less imperfect, and in most of them ether was resorted to for the completion of the operation In eighteen cases ethyl chloride was used at the end of the evipan narcosis, which was thus prolonged for some five to ten minutes with no ill effects Post narcotic excitation occurred in about 1 per cent., and necessitated the administration of large doses of morphine Post-narcotic vomiting and nausea were also observed in about 1 per cent There were no deaths As persons up to the age of 25 to 30 are liable to be restless even under a large initial dose, and to suffer from post operative excitation, the author prefers to give them ether Old people, on the other hand, tolerate evipan remarkably well, and usually need very little of it—for instance, in the case of a woman aged 80, with a fracture of the femur requiring an operative fixation which took twenty minutes to perform, only 1 5 c cm of evipan was needed The largest dose, which was 30 c cm , was given to a man aged 52, in whom resection of the stomach for gastric ulcer took 105 minutes The longest operation lasted 120 minutes, during which time 14 c cm of evipan was given to a man aged 69 whose stomach was resected for cancer The author considers that evipan is only contraindicated in cases of advanced hepatic insufficiency, and to a certain extent in young people He has had no experience of evipan narcosis in childhood

305 A Long and J A Maxwell (*J roy nav med Serv* July, 1937, p 194) have used evipan anaesthesia as a simple administration in 266 operations, and as a prolonged anaesthesia with saline and glucose in 176 No case gave cause for anxiety, and they regard the method as safe in competent hands They state that its chief advantages are (1) it produces pleasanter, smoother, and more rapid induction than any inhalation anaesthetic , (2) the recovery is pleasant for the patient, and there is a complete absence of post-anaesthetic complications , (3) it is easily administered, and repeated administration does not appear to have any ill effects , (4) it gives a relatively bloodless operation field , and (5) its cost compares favourably with that of other anaesthetics Its main disadvantage is that relaxation is insufficient for major laparotomies by midline incisions In some cases the skin is slightly sensitive even when anaesthesia of the deeper layers is adequate

306 I Hofer and K Eberle (*Wien klin Wschr* July 30, 1937, p 1126) are satisfied with their trial of sodium evipan narcosis in 130 tonsil and adenoid operations in children They used no preliminary medication, and attach much importance to very slow intravenous injection , they injected 1 c cm of fresh 10 per cent solution during one minute until the child ceased to count, slept, and snored If snoring did not occur or restlessness was noted a further 0 5 c cm was given to children under 6 years, or 1 c cm if older Children aged from 1½ to 2 received from 1 to 2 c cm and from 2½ to 3, 2 to 2½ c cm , while children aged 4, 5 to 8, 9 to 11 and 12 to 14 received respectively 2 to 3, 2½ to 3, 3, and 3 to 4 c cm With a slow injection the dosage could be graduated to

and long tradition and its modern spirit During the B M.A world tour Dr Fairbairn proved himself a good shipmate and a good sailor with a friend or friends in every port of call nearly all of them St Thomas s men The last toast was that of ' The Chairman, proposed by Dr A E Russell who spoke of the great public spirit of John Fairbairn and his breadth of view St Thomas s men always wanted to see him again whenever he could spare time to come to London from his home in far Lossiemouth After the chairman's acknowledgement of the kind words that had been spoken of him the rest of the evening was spent informally

---

On the afternoon of October 8 Sir Edward Poulton, F R S, president of the British Association, distributed the medals certificates and prizes won by students of Guy s Hospital Medical and Dental Schools during the 1936–7 session Lord Nuffield treasurer of the hospital, presided over the ceremony, which was held in the Medical School In his inaugural address for the new session Sir Edward Poulton spoke on Evolution, and illustrated his remarks with lantern slides

CONDITION OF REFUGEES IN CATALONIA

We have received from Dr Richard W B Ellis a copy of the report drawn up by himself and Dr Audrey E Russell on the condition of refugees in Catalonia which they have presented to the National Joint Committee for Spanish Relief This report is based on an examination of existing conditions—(1) on the arrival of refugees from the Northern Spanish provinces at Puigcerda , (2) in the refugios and hospitals provided for their reception in Barcelona , and (3) in representative refugee colonies throughout Catalonia During their tour Drs Ellis and Russell were able to visit seventeen colonies in the provinces of Barcelona, Tarragona, Lerida, and Gerona , the Stadium refugee hospital, the trachoma home, and two reception refugios in Barcelona the refugee hospital in Gerona the general and military hospitals in Figueras , and the record office in Barcelona Their observations and conclusions are summarized as follows

Summary of Medical Report

1 There are conditions approaching famine amongst refugees in the north of Catalonia and in remote villages in the south This is principally due to lack of food throughout the whole province, but also partly due to breakdown in transport owing to the extreme shortage of petrol

2 The most urgent necessity at the moment is for milk Although it has been possible to maintain the production of crops the extensive slaughter of cattle for food will prevent an adequate home production of milk for a long period

3 There is a universal shortage of winter clothes, blankets and shoes, which is becoming increasingly severe with the onset of winter and the continued influx of refugees

4 In view of the verminous condition of many of the refugees the lack of soap is a serious danger , although there have as yet been no cases of typhus recognized conditions are such as to favour its epidemic spread if the disease should once occur

5 The principal medical dangers are at present those arising from the spread of trachoma tuberculosis and typhoid fever

6 Medical supplies of all kinds including particularly anaesthetics sedatives, rubber gloves dressings anti-diphtheritic sera etc , are urgently needed in Figueras and Gerona

MOTOR CARS FOR 1938

THE EARL'S COURT EXHIBITION

[From Our Motoring Correspondent]

This year s Motor Exhibition, the thirty-first organized by the Society of Motor Manufacturers and Traders, which opened on Thursday, October 14, and will continue until Saturday, October 23, took place for the first time in the large new exhibition building at Earl s Court The new building is larger than Olympia, and has the advantage that the different sections of the show—cars, special coach-work, caravans, and motor boats—are all on the ground floor of one hall, with the accessories and components in the galleries Altogether the products of fifty-eight different car manufacturers are displayed, the international character of the exhibition being well maintained

Some Modern Trends

It is not an easy matter this year to summarize the general trend of things in the motor industry, for while the popularity of cars with four cylinder engines has led several manufacturers hitherto only building vehicles with engines having six or more cylinders to introduce again a four,' at least one firm has decided to drop its four cylinder cars and confine itself to sixes " The renewed popularity of engines with four cylinders in the case of cars up to about 14 h p is due both to improved design of the engine components and to the greater use of rubber in fixing the power unit in the chassis with the object of overcoming any inconvenient vibration As a result of the increased cost of steel and other raw materials, the majority of car manufacturers have found it necessary to raise their prices to the extent of about 5 per cent but a few firms have been able to offer their productions at somewhat lower prices than last year Whether slightly dearer or even cheaper, the 1938 cars by reason of the various detail improvements the very complete equipment of accessories and conveniences now included in the price, and the generally more attractive appearance and comfort, are excellent value for money

Body Designs

The show is very largely one of covered cars either saloons or coupés very few open vehicles being seen, and these mainly for the sporting class of motorist In this connexion it is interesting to mention that the Austin Co , except on the Austin Seven has now ceased to produce open bodied cars So far as the outward appearance of motor vehicles is concerned it may be said that freak designs in streamlined bodywork are conspicuous by their absence, designers having settled down to a slightly sloping front and rear with luggage and spare wheel and tyre receptacles in the latter Certain minor changes from last year are in evidence, as for example a greater use of metal strips instead of wire mesh for the guards to engine radiators and the painting of the frame or shell of the radiator to correspond with that of the car body, in place of chromium plating The practice of placing the front and rear seats between the axles to afford more comfortable riding is extending while on some cars the front seat is being made sufficiently wide for two passengers in addition to the driver Improvements have also been introduced in the seats themselves those at the front now usually having tubular frames which can be adjusted as to height tilt and also the amount of leg room available Even on small cars an increase in passenger space is noticeable, while in a number of vehicles the rear seat flooring is now flat instead of having separated foot wells

Bette Vision for Drivers

One important improvement in motor bodywork is a thinning down of the body pillars at the two ends of the windscreen, which results in the driver having a clearer

Obstetrics and Gynaecology

312 Urinary Incontinence

V Schrattenbach (*Zbl Gynak* July 31, 1937, p 1848) points out that the female urethra is not closed by a circular sphincter but by the striped and unstriped muscles which raise the posterior wall of the urethra and the base of the bladder, and also by compression by the filling bladder of the part of the urethra which is directed tangentially to its base The surgical plastic procedures which in incontinence endeavour to restore or supplement the physiological support which has disappeared are (1) direct muscular plastic operation by sutures uniting the musculature of the trigone with para-urethral tissue on each side, combined with colporrhaphy, (2) vesicovaginal interposition of the uterus, (3) Franz s plastic operation in which the pedicles of levator ani (pars pubica) from the two sides are sewn over the bladder neck and urethra, (4) Martius s plastic operation in which strips of the bulbocavernosus are used similarly, (5) Martius s plastic operation consisting in 'bolstering the urethra by strips of fat and muscle from the ischio cavernosi, and (6) a plastic procedure in which portions of pyramidal fascia are used The Franz and Martius methods are preceded by a direct muscular plastic operation In fifty-six patients who were traced from six to twenty four months after such operations Schrattenbach found only six who had not remained cured, none of the seventeen operated on by the bulbocavernosus plastic operation had had any recurrence He concludes that direct plastic operation combined with colporrhaphy is sufficient in the cases with slighter anatomical lesions, that whether the bundles transposed from pelvic floor muscles act as a muscular sphincter or merely as a support they are usually effective, and that the pyramidalis-plastic operation (Goebell-Frangenheim-Stoeckel) is rarely required

313 Short-wave Treatment of Salpingitis and Metritis

F Lobre (*Dtsch med Wschr* July 9, 1937, p 1096), who is in charge of the gynaecological department of the Salpêtrière Hospital in Paris, gives an account of his experiences with short-wave treatment of 350 cases of salpingitis and seventy cases of metritis It was found desirable in the treatment of inflammatory conditions of the uterine appendages to obtain a definitely thermic action by the short waves, the lengths of which were from 12 to 16 m The exposures were very short, not lasting more than five minutes Although the 350 cases included several for which diathermy had been previously prescribed failures were recorded in only 10 per cent The technique of the short-wave treatment of metritis was different, exposures of three to six hours at a time being given with a wave-length of 15 m This treatment of metritis was supplemented by protein shock induced by the intravenous injection of a proprietary preparation of protein In some cases a complete cure was effected at a single sitting, the discharge from the uterus ceasing and the ulcers of the cervix healing, but two sittings were usually required and occasionally three The patients who returned to hospital for re-examination some months later were still free from their discharge The author does not profess to understand the biological processes leading to such recoveries, and is inclined to discount the therapeutic value of the induced fever, for it was not very high, and experience has shown that in gonorrhoeal metritis a temperature of at least 105° F must be maintained for a considerable time if it is to be beneficial By short-wave treatment a successful response was obtained in gonorrhoeal metritis without the rectal temperature ever exceeding 102 F Good results were also obtained with staphylococcal, coliform and streptococcal infections of the uterus Protein shock treatment alone was not even approximately as effective as when it was combined with short-wave treatment The author adds a warning to the effect that care is needed in the wholesale employment in all cases of metritis of this particular treatment, which requires skilled and close supervision

Pathology

314 Traffic Accidents and Alcohol

H S Nissen-Lie (*Tidsskr norske Laegeforen* August 1, 1937, p 799) has investigated the conditions under which traffic accidents occurred in Oslo in the two months from November 20, 1936 to January 20, 1937, with special reference to the alcohol found in the blood of 160 persons brought to a first-aid station Apart from the six persons coming to the station more than twenty-four hours after injury, there were fifty male and twenty-five female pedestrians, twenty-four children under the age of 14, twenty five passengers, twenty cycling messenger boys, and ten motor car drivers None of the cycling messenger boys seemed under the influence of alcohol, and only two of the twenty-five female pedestrians showed definite signs of alcohol poisoning Analyses of the alcohol content of the blood of thirty-three of the fifty male pedestrians showed that all but five were under the influence of alcohol the concentration of which in the blood of these five cases was under 60 mg per 100 ml The lowest figure among the analyses rated as positive was 123 mg per 100 ml, and the highest was 350 mg per 100 ml In as many as fifteen cases the figures were between 200 and 300 mg per 100 ml, and only in eight cases did the analysis show more than 300 mg per 100 ml This study suggests that considerably more than half of the adult male pedestrians who are victims of traffic accidents in the streets of Oslo are under the influence of alcohol at the time The author concludes that most traffic casualties belong to one or other of three groups—namely, children, drunken adult males, and cycling messenger boys

315 Suprarenal Glands in Diphtheria

A Maclean (*J Hyg* Camb, July 12, 1937, p 345), who records twelve illustrative cases in patients aged from 9 to 19, maintains that the suprarenal glands, like other organs, suffer from the presence of diphtheria toxin in the body In cases in which the intoxication is at a minimum, in laryngeal diphtheria for instance, there is little or no change in the suprarenals, but if the intoxication is greater the lymphatic glands along the suprarenal vein are inflamed and haemorrhages are found in the cortex and medulla, and in the worst cases are seen on the surface of the organ Maclean shows that the administration of sodium chloride, which is one of the accepted methods of treating deficiency of the suprarenal cortex, is of distinct value in the treatment of diphtheria

316 Agglutinins in Typhoid Fever

G L Salvati (*Minerva med* July 29, 1937, p 97), after investigating the cerebrospinal fluid of twenty cases of typhoid fever, invariably with negative results whatever the stage of the disease, comes to the conclusion that under ordinary conditions typhoid agglutinins which appear in the blood within a few days of the onset never pass into the cerebrospinal fluid Although he did not actually see any instances of meningo-typhoid fever, he examined several cases with signs of meningeal irritation, such as delirium, nuchal rigidity and headache, and in these also he failed to find agglutinins in the cerebrospinal fluid No agglutinins were found in cases treated by vaccine therapy

turers announced their 1938 models some weeks ago it has become usual for a few of them to keep as a show surprise details of one or more entirely new models Thus, the Vauxhall Co in addition to the 25 h p 12 h p, and 14 h p cars has introduced a 'Ten four seated saloon embodying independent front-wheel suspension and other special features at an attractive price

Among the Accessories

As at Olympia, the galleries at Earl s Court are devoted to an almost inexhaustible array of special fittings and accessories for cars Probably in view of the new motor lighting regulations which have just come into force chief interest lies in the latest production of lamp manufacturers, designed to conform with the legal requirements which now apply to old as well as to new cars Briefly stated, it is now necessary for headlamps to be permanently deflected downwards or fitted with some form of device which, by deflection of the light downwards or both downwards and to the left, renders the beam incapable of dazzling any person on the road, and for sidelamps to be fitted with bulbs of a capacity not exceeding seven watts and to have fronts of frosted glass or other material having a diffusing effect Purchasers of new cars will have no difficulty with these regulations but in the case of old cars it is for the owners to make themselves acquainted with the most satisfactory and convenient methods of converting their lamps in order that they may not infringe the regulations There are also many examples of lamps specially adapted for driving in fog many of which are fitted with yellow glasses, despite the fact that the Department of Scientific and Industrial Research has recently reported that none of the advantages claimed for such coloured glasses have been substantiated (see p 765)

Finally, it may be mentioned that the exhibition is open daily, except Sunday from 10 a m until 10 p m, and that the price of admission is 2s 6d except on Tuesday October 19, and Thursday October 21, when it is 5s up to 5 p.m and 2s 6d afterwards It may be added that the Ford Company is as usual, holding its own exhibition at the Albert Hall, Kensington where the latest models of the Ford 8 h p, 10 h p and 22 h p V8 cars are being displayed It is proposed in next week s issue to follow the customary plan of referring to some of the new car models, more especially to those likely to appeal to medical men from the point of view of suitability, reliability, and both purchase and subsequent maintenance costs, as well as to some of the modern accessories which add to the convenience of motoring particularly in the wintry period of the year now before us

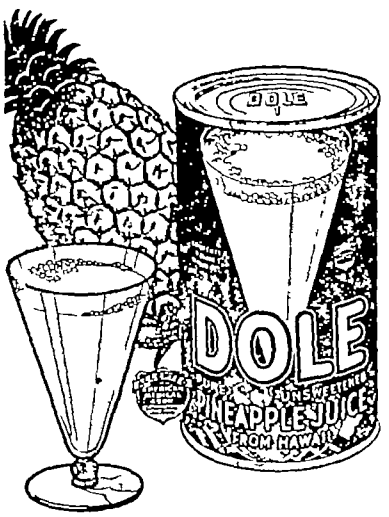
C J W

On October 7 Lord Derby Chancellor of Liverpool University, visited Runcorn to open new extensions to the Evans Biological Institute In introducing Lord Derby, Mr T Edward Lescher drew attention to the fact that the organization known as the Evans Biological Institute is the result of continuous development during the last twenty-five years and that it originated as a laboratory and farm station in connexion with the Liverpool Institute of Comparative Pathology under the aegis of Liverpool University It was in 1903 that Professor (afterwards Sir Rubert) Boyce and Professor (afterwards Sir Charles) Sherrington together with Dr H E Annett then lecturer on comparative pathology at the university conceived the idea of establishing a farm station at Higher Runcorn for the study of comparative pathology In 1911 the Institute was taken over by Evans Sons Lescher and Webb for research purposes and became a branch of their business The scientific tradition established in those early years has always been maintained and mainly concerns immunology and biological therapy As the result of the progress made the present laboratories were completed in 1928 and a year ago the new additions were begun on the site of the older works

Reports of Societies

SCIATICA

The opening meeting of the sixth session of the Mid-Staffordshire Medical Society was held on October 5, with Dr A E HODDER presiding Dr C W BUCKLEY of Buxton read a paper on sciatica



Sciatic pain, he said, might be due to inflammation of the nerve sheath at any part of its course, to irritation of or pressure upon the nerve trunk, or it might be a referred pain from visceral or other causes The nerve might be affected within the spinal canal, in the foramina through which the nerve roots emerged, in the pelvis, or in the thigh The simplest form of classification was into root sciatica trunk sciatica and sciatic neuralgia, a referred pain It was important to form a clear idea of the anatomical relations of the nerve, and to determine if possible the part affected A large proportion of cases were due to pressure upon or inflammation of the fifth nerve root in its passage through the foramen and the pain in the thigh and leg was often found to be limited to the distribution of this root The foramen between the fifth lumbar vertebra and the sacrum was the narrowest of those in the lumbar spine while the root was the largest and filled the foramen almost completely Lumbosacral and sacro-iliac strain were very likely to set up fibrositis in the region of the foramen, and thus to cause troublesome sciatic pain, probably the majority of cases of sciatica were due to such causes Fibrositis of the gluteal muscles, the pyriformis and adjacent structures was responsible for another large group of cases

All patients who did not quickly respond to treatment should have an x ray examination to discover whether there was any disease of the bones, such as osteitis malignant growths, etc A rectal examination might supply important information, and should be a routine Inspection of the back for abnormal curvatures muscle spasm or wasting tender spots, etc, must never be omitted Lasègue s sign called for care in interpretation while the nervous reflexes should be investigated, for the Achilles tendon jerk would be lost in cases of root sciatica of any severity There were many conditions which might give rise to difficulty in diagnosis but careful examination on a systematic plan excluded most of them

General Lines of Treatment

In treatment rest was of primary importance and a few days in bed at the outset would materially shorten the duration of the disease in most cases Analgesics were usually required, and if the pain was severe morphine might be necessary, but it should be regarded as a method not of treating the disease but of enabling the disease to be treated It was well to remember that a loaded colon might be the cause of sciatica and an effective purgative sometimes worked wonders Heat in various forms was always helpful and when the acute stage had passed massage might be begun though very gently at first Where sacro-iliac or lumbosacral strain was present strapping the pelvis was useful and a belt might be worn later to prevent recurrence as far as possible The injection of novocain in saline was a most valuable method of treatment and might be epidural, or into the sciatic foramen or along the trunk of the nerve, according to the area affected Manipulation was helpful in breaking down adhesions in cases of long standing or for the treatment of sacro iliac strain Among other methods, dry cupping ionization, and diathermy might be tried but drugs were of little service

Drs A V CAMPBELL A E HODDER and F J MORRIS and Mr ERIC YOUNG and Mr G A CARTER took part in the discussion which followed

To a high degree the important fresh-fruit constituents of ripe pineapple are in

THIS ORIGINAL PINEAPPLE JUICE
FROM HAWAII

WE believe you as a doctor, interested in the welfare of your patients, will insist on quality and goodness in every fruit juice that you may recommend These facts, then, will interest you Dole Hawaiian Pineapple Juice is the original Hawaiian pineapple juice It has received the Seal of Acceptance of the American Medical Association's Committee on Foods It is a natural source of vitamins A, B, and C The exclusive Dole Fast Seal Vacuum Packing Process retains in high degree those important fresh fruit constituents which you want when prescribing a fruit juice to your patients

J K. Husband & Co , Ltd , 10 Eastcheap London E C 3

Here is a typical analysis of Dole Pineapple Juice

Moisture	85 3%
Ash	0 4
Fat (ether extract)	0 3
Protein (N x 6 25)	0 3
Crude fibre	0 02
Titratable acidity as citric acid	0 9
Reducing sugars as invert sugar	12 4
Carbohydrates other than sugars (by difference)	0 38

THE TORCH FISHERMAN—On still nights off Waikiki can be seen the flickering torches of Hawaiian fishermen. The glare from the fiery stick attracts the fish and with one swift movement of his spear the fisherman has impaled his breakfast.

P.S. If you would like a free sample tin of delicious Dole Hawaiian Pineapple Juice, write us a line on your letterhead now and we will send you a sample tin at once free

Nestlé's HOMOGENISED Fruits & Vegetables
simplify infant feeding

THE problem of how vegetables and fruits could be added to the milk diet without any disturbance to digestion has been solved by the homogenisation of these foods This process breaks down the cell walls and reduces the foods to such fine particles that they are as easily digested as milk Nestlé's now supply Homogenised Fruits, Vegetables and Soup in correctly balanced combinations Thus guesswork for the mother is eliminated, and the medical adviser can be sure that his instructions for adding fruits and vegetables to the milk diet are carried out to the letter

A booklet on the subject and a description of the foods, together with ample supplies for your own investigation are now available, and will gladly be sent on receipt of the coupon below

very good results Colonel Russell insists that more attention must be paid to malnutrition, wherever prevalent, if more rapid advances are to be made in stemming the ravages of malaria, tuberculosis, leprosy and infant and maternal mortality This involves closer co operation between nutritional research workers and food producers, more practical realization of the valuable discoveries of Sir Robert McCarrison, and more attention to the large proportion of the population of India which is still undernourished Tuberculosis has been increasing during the last three decades in towns and is now spreading to the rural villages, where the more primitive races are beginning to suffer severely It has been stated that the district of Darjeeling, which is mainly rural and by no means industrialized, has a tuberculosis death rate second only to Calcutta city in the whole Province of Bengal Colonel Russell points out that if this is verified the position demands immediate attention although effective prophylactic work will necessitate the surveying of large areas from many points of view The bovine bacillus seems to be still rare in India, very few cattle being infected and milk being almost invariably boiled before use

Research

One of the twelve sections of the report is devoted to research throughout India in the various institutes and hospitals, special attention being given to the work of the Indian Research Fund Association Many investigations in 1935 were financed by or carried out in other ways under the auspices of this body Field inquiries into cholera, malaria, and plague are yielding information which is being published in various periodicals as it is obtained Mention may also be made of a nutritional research at Coonoor, including a survey of Indian foodstuffs and the examination of children in famine camps schools, and hostels, and a dietary research by the Bombay Presidency Baby and Health Week Association In several centres postgraduate teaching is associated usefully with the research work The office of the Public Health Commissioner continues to act as the epidemiological bureau of the Government of India, and weekly and monthly statements are issued Close touch is maintained with other comparable organizations elsewhere in the world, and study tours are arranged as well as visits of delegates to international conferences

All-India Institute of Hygiene

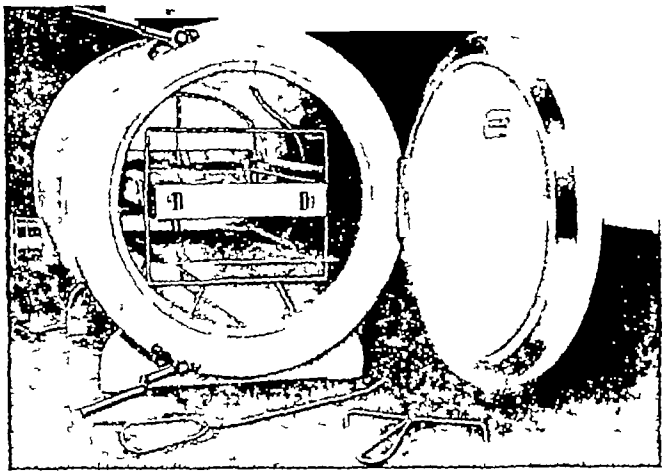
Progress is reported in 1936 in the work of the All-India Institute of Hygiene and Public Health, Calcutta, in its dual functions as a centre for advanced studies in public health and as a research organization There is an increasing demand for teaching in public health, and the accommodation for pupils was taxed to its uttermost, some applications having to be refused on account of lack of space Private practitioners still form the bulk of these students at present, but it is hoped that with the new Indian Constitution there will be a greater demand for trained public health officials in connexion with the launching of new health programmes and the formulation of new schemes particularly in rural areas The importance of practical education is being increasingly stressed the example of the Balkan States being more closely followed in this respect since it is difficult in India for the young public health officer to obtain an appointment under an experienced senior before responsibilities fall heavily upon him Among the researches being continued is the investigation into the causation of cholera epidemics As regards the basal metabolism of Indian children it has been shown that the number of calories required by children in India is no less than in European children This is of practical significance in the task of making a nutritional survey of India and the fixing of dietary standards and calorie requirements The results of biochemical studies of human blackwater fever cases were in keeping with the results obtained in investigations into malarial haemoglobinuria in monkeys A detailed and systematic programme of research into the part played by the endocrine glands in blackwater fever is now in progress In tuberculosis allergic phenomena appear to be more prominent than in Europe, and a special effort is being made to discover why there is this biological difference between the European and Indian races The elucidation of this problem will probably lead to a more accurate assessment of the prognosis and the right lines of treatment A maternal mortality inquiry revealed the importance of anaemia as a contributing factor in deaths due to sepsis, it was the sole cause of death in 18 6 per cent of the 300 cases investigated The maternal and child welfare section of the Institute was maintained during the year under review by the Countess of Dufferin Fund The inquiry into the chief causes of death associated with childbirth is continuing

---

ENGLAND AND WALES

Health Problems of Newcastle

The annual report of the medical officer of health for the city and county of Newcastle upon Tyne contains some interesting vital statistics The birth rate for the year 1936 of 15 6 per 1 000 while comparing favourably with the rates for England and Wales as a whole and for the 122 great towns, is the lowest yet recorded in Newcastle where the rate was 31.9 as recently as thirty years ago The report records with regret a maternal mortality rate of 5 92—a figure 50 per cent higher than the national figure and the highest in the annals of the city No attempt is made to attribute this entirely to the evils of overcrowding and poverty, and an inquiry is foreshadowed to discover a possible deficiency in hospital arrangements, medical and midwifery practice, or central direction The infantile mortality rate of 90 per 1 000 shows an increase over the figures of 83 and 86 for the two preceding years, and contrasts even more unfavourably with the national rate of 59 In this case however, there was an exceptional cause Several outbreaks of infective enteritis, both domiciliary and institutional, occurred during the year and there were 105 deaths among children under 2 years A special investigation of neo natal mortality has shown that deaths in the first month of life are more frequent in hospitals than at home The scope of the inquiry was confined to children born of normal labours The evidence appeared strongly to suggest that overcrowded maternity wards and inferior maternity hospital accommodation were contributory causes of neo natal mortality Plans have been prepared for a new maternity hospital of 140 beds and also for replacing the present accommodation at the Newcastle General Hospital by a modern unit with thirty beds The general death rate for the city—13 1 per 1 000—shows a slight increase Cancer continues to be second among individual causes of death and for the first time a detailed inquiry has been made into deaths from this disease in Newcastle It was found that in 11 per cent of cases there had been delay in seeking medical advice that in one case in ten diagnosis was delayed by the necessity for further investigation and that one third of the cases proved to be completely resistant to every form of treatment even when promptly and efficiently applied after early diagnosis In the majority of cases diagnosis was rapid and admission to hospital without delay Facilities for deep *x*-ray therapy were not wholly adequate As a result the Schools and Charities Committee of the corporation proposes to establish and maintain a special department for this purpose at the Newcastle General Hospital, to be completed in 1938 Among zymotic diseases diphtheria shows a record incidence of 693 cases although large numbers of children have been protected by immunization There were fifty three cases of bacillary dysentery, in which the diagnosis was bacteriologically confirmed This figure, though high



STEADILY FINDING FAVOUR.

MAW STEROTHERM

HOT AIR ELECTRIC AUTOMATIC STERILIZER

Patent No 427581

Maw Sterotherm Automatic Sterilizers have been installed in the London, Westminster and many other Hospitals, Surgeries, etc throughout the country and are functioning with the utmost efficiency The special features of the Sterotherm ensure complete sterilization of Instruments, Dressings Oils, etc, by the Hot Air method It is the ideal unit where economy of space and outlay are essential

May we send you details or arrange a demonstration ?

SPECIAL FEATURES

- Efficient Sterilization
- Automatic regulation of temperature.
- No supervision necessary while in use.
- Very small current consumption
- Articles in apparatus remain sterile until required, as closure is bacteria proof
- Dressings quite dry after leaving Sterilizer
- Convenient size—length 16½ in diameter 9½ in

dealt with by the various members of the staff of the Royal Infirmary in successive weeks The course is mainly clinical, with the addition of demonstrations in instrumental methods, morbid anatomy bacteriology, radiology, dietetics and physiotherapy as connected with the different sections of the course The Honyman-Gillespie lectures will be delivered in the West Medical Theatre of the Royal Infirmary on Thursdays during the course at 5 o clock, and the names of the lecturers and titles of the lectures are as follows October 21, Professor W T Ritchie, Disordered Circulation of the Interstitial Fluid" October 28, Dr Edwin Bramwell, The Pupil Reactions', November 4, Professor D K Henderson, "Suicide", November 11, Dr Fergus Hewat, The Lungs and Pleura November 18, Dr John D Comrie, Diet and Dyspepsia', November 25, Professor D M Lyon, The Importance of Urinary Reactions in Disease and Treatment", December 2, Dr John Eason, 'Toxic Goitre", and December 9 Dr Alexander Goodall, 'The Management of Pernicious Anaemia

Pathology and Clinical Medicine

Professor J S Young, M D, recently appointed to the chair of pathology at Aberdeen University, delivered his inaugural lecture on 'Pathology The Political Economy of the Human Body' on October 5, Principal J H Fyfe presiding Professor Young said he had had the advantage of teaching pathology in a new institute of pathology at Belfast, which was situated in the grounds of the hospital and in Aberdeen a new department of pathology was in process of erection within the gates of the Royal Infirmary It would share a floor with the department of medicine, while the sister subjects of bacteriology, clinical chemistry, materia medica surgery, and midwifery would be accommodated under the same roof This policy of centralization in immediate contact with the hospital was advantageous to students, teachers, and the public alike

Correspondence

Treatment of Cancer of the Breast

SIR,—Mr Geoffrey Keynes in his article in the *Journal* of October 2 admits the need for further pathological investigations in breast cancer, and appears to have accepted the revolutionary conclusions of Mr J H Gray as a guide to practice It is therefore important to point out that Mr Gray has only issued an interim report of his work It has not been published in such a form that it can be subjected to the usual processes of criticism He has made a series of statements which have received the *imprimatur* of the Cancer Research Committee of St Bartholomew s Hospital and the approval of Mr Keynes, but for which the evidence is still to seek

Mr Gray denies the presence of lymphatic vessels in the papillae of the skin and in the fasciae apparently entirely on the ground that thorotrast injection fails to demonstrate these vessels On similar evidence it would be easy to disprove the existence of Mecca simply by making an unsuccessful attempt to reach that city and by a refusal to read the works of previous travellers who have succeeded Ranvier demonstrated the papillary lymphatics of the skin of the rat s ear many years ago Hyrtl injected the human papillary lymphatics and his specimen remains in University College Museum to this day As to the lymphatics of the fasciae it may be observed that Heidenhain in twelve out of eighteen cases of breast cancer found cancerous lymphatics running from the breast to the pectoral fascia From his observations he concluded that cancer generally advanced along these vessels and along those of the pectoral lymphatic plexus by a process of continuous growth, less often by embolism This was in 1889 After he has reached this stage of the subject I may refer Mr Gray to the work of Langhans and Stiles and to my own books

I am delighted that Mr Gray has devoted himself to a study of lymphatic anatomy and that he has found a new and ingenious method of approaching the subject But when on such flimsy evidence he denies the spread of breast cancer by permeation in the deep fascia—one of the best-established facts in pathology—it is necessary to state plainly that such views are a menace to the effective treatment of the disease whether by surgery or by radiation Their adoption would soon lead back to the days when local recurrence after operation was the rule

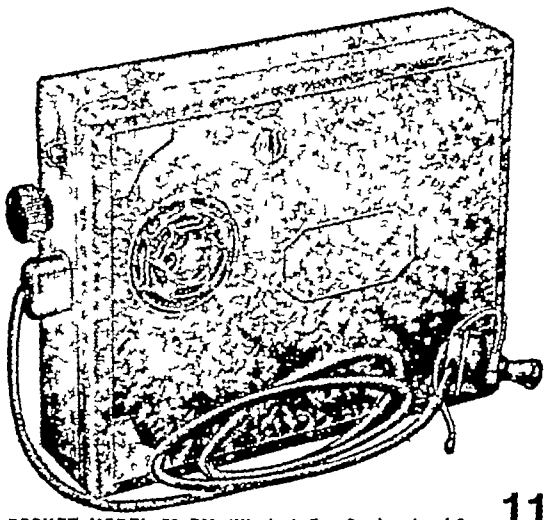
Further investigations on the dissemination of cancer of the breast are no doubt desirable, as Mr Keynes rightly says Meantime the results of those already made may be commended as a subject of study within the walls of St. Bartholomew s —I am, etc,

London W 1 Oct 7 W SAMPSON HANDLEY

The Scope of Orthopaedic Surgery

SIR,—Mr S E Duff asks for a ruling on the limits of orthopaedic surgery (*Journal* October 9, p 726) There is no better definition of the field of orthopaedic surgery than the one which was ultimately adopted by Sir Robert Jones— the treatment by manipulation, operation, re education, and rehabilitation of the injuries and diseases of the locomotor system All the conditions included in Mr Duff's list of cases form part of the routine practice of modern orthopaedic surgery Orthopaedic surgery, however, is not a specialty divorced from surgery as a whole, it remains an integral part of general surgery" It thus follows that the general surgeon has an undisputed right to treat *if he so desires* any of the cases in Mr Duff's list referred to him in hospital or private practice — I am etc.,

Manchester Oct 11 HARRY PLATT



Elongation and Dilatation of the Colon

SIR,—In the *Journal* of July 24 (p 154) Professor J R Learmonth in a paper dealing with the elongation and dilatation of the colon, states in his section on the treatment of megacolon

> Of the many technical procedures suggested by far the most eclectic is that devised by Telford and Stopford (1934) and I consider that it should be employed exclusively It consists in the resection of the mesially directed branches of the lumbar ganglia from the second to the fourth inclusive, and avoids the paralysis of the vasoconstrictor nerves to the legs which follows the (equally efficacious) removal of the lumbar cords and the sterility which follows resection of the presacral nerve in male patients

I would suggest to Professor Learmonth that this identical proceeding was suggested by Mr H C Trumble one of our Baker Institute workers and carried out successfully on four patients as early as 1931 In dealing with the question of sympathectomy of the distal colon in the treatment of Hirschsprung s disease Mr Trumble states The simplest way to do this is to divide the lumbar splanchnic nerves just proximal to the inferior mesenteric ganglion Five patients were operated on but in addition to the above operation on the first patient only the left sympathetic trunk was cut (*Med J Austral.*,

British Medical Association

B·M·A·House. Tavistock Sq. W.C.1

Sir Henry Gauvain telephoned the next morning that there was no doubt whatever about the diagnosis, and I was able to supply him with the seventeen doses necessary to immunize the non immune contacts, and no further case occurred

I have been able in my own district not only, as I have said before to keep the hospitals going, but also to deal with private cases where small children or invalids were at risk My serum has on each occasion been supplied by volunteers from the Rover Scouts They have been provided with a certificate over the seal of my council commemorating their good deed I tried to arrange with Lord Baden Powell that there should be some decorative reward for such services as these, which are of inestimable value but which were not contemplated when the scout movement was inaugurated The committee of the Scout Association considered the matter, and despite an early enthusiastic reception of my approaches the final resolution was that until the profession itself made a call for the service there was not sufficient evidence for them to start a campaign

Surely in the circumstances it is time the profession utilized the information at its disposal and also utilized the services which would undoubtedly be forthcoming from the Rover Scouts provided the mind was made up and the application made for assistance Unfortunately it seems hardly to be recognized what a scourge measles really is Those of us in the public health service have year after year to chronicle the fact that the deaths from measles and whooping-cough exceed those of all the other infectious diseases put together It is time the profession made its voice heard in order to do something to wipe out the scourge of measles—I am, etc.,

Public Health Department, Hounslow Oct 1 ELWIN H T NASH

SIR,—The recent article by Sir Kaye Le Fleming (*Journal* September 25, p 612) and Dr Sinclair Miller's letter (October 9, p 725) are apt to give the impression that adult serum is useless in the prevention of measles

My own experience with fifteen cases of children under the age of 8 is very much to the contrary All were given from 7 to 10 c cm of parents serum from blood taken the day before, and all had been in intimate contact with infected brothers or sisters in country cottages One child developed the rash three days after inoculation which in this instance was obviously given too late Of the remaining fourteen two had very mild attacks with pyrexia for two days and the rest escaped The discrepancy may easily be explained by the difference in the ages and therefore weights, of the subjects I suggest that a dose of 3 c cm per stone weight would protect if given before the sixth day after exposure, and 2 c cm. per stone weight might have prevented the occurrence of otitis in three of the nineteen cases inoculated early in the incubation period—I am, etc

Finchampstead Berks Oct 4 E BILLING

Endotracheal Anaesthesia

SIR—With some diffidence I enter the controversy regarding the use of endotracheal anaesthesia in thyroid surgery As one of the anaesthetists who has given some thousands of anaesthetics for Mr Cecil Joll for thyroid cases the majority being by the endotracheal route I can state that we have found that many of the disadvantages put forward against this method do not appear in actual practice There is undoubtedly a division of opinion as to the desirability of using endotracheal tubes in thyroid work as a whole but most anaesthetists and surgeons would agree, I believe, on the advantages they offer in cases with obstruction to the airway by pressure on the trachea, and especially in cases of malignant goitre It is possible that the prejudice against an endotracheal tube dates from the time when the stiff, unyielding type of tube was used, before Dr Magill introduced the soft rubber catheter

While I would make no claim that an endotracheal tube is essential for all thyroid work, it seems going to the opposite extreme to deny to all thyroid patients—as was suggested by Dr Ivor Lewis in his article of September 25—the benefits which go with endotracheal anaesthesia—I am etc

London N W 3 Oct 9 CLAUDE W MORRIS

Spinal Anaesthesia for Caesarean Section

SIR—I was interested to read Dr Herbert Spencer's letter in the *Journal* of October 9 (p 723), on spinal anaesthesia for Caesarean section but I cannot let his opinion pass unchallenged I have used spinal anaesthesia for Caesarean section for many years and am satisfied with its advantages not only where ordinary obstetric indications are present but especially when heart disease or lung disease is present My anaesthetist, Dr J C A Norman, and I have found it free from danger under the technique we have evolved We have never yet found a fall in blood pressure The technique includes (1) premedication and (2) the use of spinocaine—lighter than cerebrospinal fluid—as the anaesthetic which is given with the most rigid antiseptic precautions and with meticulous attention to many details We are convinced of the safety and advantages of this method—I am etc,

Bournemouth Oct 9 S GORDON LUKER

Indications for Induction of Abortion

SIR—I should like to add my support to Dr J H Hannan's plea (October 9 p 726) for legal sanction of induction of abortion in cases of incest and rape The amount of wretchedness caused by these pregnancies has to be seen to be fully believed

Some time ago I was asked for a second opinion on a girl of 16 who three months previously had been assaulted on her way home one evening by an unknown man By her struggles she succeeded in preventing penetration and the sexual act was limited to an extrusion of semen at the orifice but pregnancy ensued On examination the hymen was intact The parents and the girl were distraught but physically she was perfectly fit and, with the law as it stands I had to decide against termination

Admittedly this was an unusual case but it was definitely against the public interest for that pregnancy to continue and yet the law makes no provision for such Like Dr S W Wright, I trust that the law will never be altered so radically as to include all unwanted pregnancies but in like manner as the law of divorce has recently been widened so the law of abortion should and indeed must inevitably be amended to include pregnancies arising from incest and rape—I am etc,

London W C 1 Oct 11 W G BURNS

SIR—If Dr F M R Walshe would restrict his letter (October 2 p 678) to facts his criticisms might be helpful But when he reads my thoughts, not only bluntly but inaccurately, and comments on the result, he is on much less sure ground In fact, the conclusions that he draws are entirely unwarranted Far from there being an

WARM, DRY BEDS FOR OPERATION AND ACCIDENT CASES

In cases of sudden emergency and for everyday use, the "Thermega" Electrically-Heated Blanket is invaluable for providing warm damp-free beds Hospitals and Nursing Homes throughout the country use 'Thermega.' It is the one proven remedy for driving out dampness and ensuring warm beds at the turn of a switch.

The "Thermega" Electric Pad for local application is ideal for relief of all pain

'Thermega' Electrically Heated BLANKETS & PADS

Blankets from 3 gns *Pads from* 31/6 3-*Temperature Blankets for medical use* £8 10s. Single heat Blanket specially strengthened from £4 4s Various sizes and prices on application

Insist on "Thermega." It is vital that these appliances should be made by experienced manufacturers

A refrigerator should be in every home

Many cases of family illness are averted by medical practitioners pointing the way to the better care of food in the home by the use of a refrigerator Imported meat comes in ships' holds scientifically maintained at proper temperatures The nation's milk supply is appropriately guarded at the right temperature, but in too many homes such safeguards are neglected from the moment the food or milk is bought from the shop An electric refrigerator in the home can be relied upon to keep food below 50° F even in the hottest weather—a temperature at which the growth of bacteria is arrested, and electric refrigerators are within the reach of most families in these days and offer the finest assurance of wholesome food within the layman's reach

For further information apply to the British Electrical Development Association, 2 Savoy Hill, London, W C 2, or consult your local Electricity Authority

"The Other Half" of Medicine

Sir,—I should like, if I could, to help bridge the gulf between medicine and its other half, which seems to have been somewhat widened by recent correspondence

It is indeed futile to try to cure with drugs a true case of conversion hysteria in a patient who has found in his or her symptom a solution of an emotional problem, a solution which is reflected in the serenity, the 'belle indifférence' of the patient with a hysterical paralysis, or aphonia or whatever it may be But there is another type of patient who also manifests physical symptoms for which no organic cause can be found, whose personality shows no signs of a solution of any problem, who clearly suffers mentally as well as physically In these patients emotional stress is disturbing the healthy functioning of the body and although there may be some symbolic significance in the function which breaks down (for example, the acute constipation of a girl who feels she cannot permit herself any outlet for her aggressive and/or creative impulses because of what she feels to be the stronger claims of parental devotion) the expression of the emotional conflict in the language of physical symptoms represents *stress* rather than *solution*

In cases such as these physical measures are surely demanded even though the aid of the other half of medicine will be required to reach the real cause of the symptom In such cases the psychotherapist (who when conducting a deep analysis often finds it wisest to avoid medicating the patient himself) needs close co operation with the physician (usually the family doctor) if he is to help his patient to full bodily and mental health Often it is only when the acute distress caused by such manifestations of mental stress as insomnia headache nervous vomiting etc is relieved by sedatives that it is possible for the patient to co operate satisfactorily in psychological treatment Moreover such medication is not necessarily interpreted by these patients as an assumption that the source of their trouble is organic (as it would be in the case of the true hysteric) for they are usually persons of good intelligence and capacity for insight, who are prepared to accept the fundamentally psychogenic nature of their illness when this is suggested to them

May I urge that there is still so much concerning the physical functioning of the body in its interrelations with the emotional life about which we are still most profoundly ignorant that psychotherapists no less than physicians practising ordinary medicine can only hope to advance in knowledge if they work in closest co-operation and on the same patients—I am etc

London W C 1 Oct 8 Laura Hutton

Pernicious Anaemia with Diabetes Mellitus

Sir—It might be of interest, in view of Dr H G McGregor's interesting paper (*Journal* September 25 p 617), briefly to give the case history of a patient of mine at present undergoing treatment for the same conditions

A widow aged 59 had a two years history of attacks of *B coli* infection of the urinary tract. During this period she had no obvious anaemia the haemoglobin percentage being 85 and the urine was sugar free In July 1937 she was noticed to be markedly anaemic in appearance and was admitted to hospital for investigation (July 31) The blood picture showed a typical pernicious anaemia haemoglobin 42 per cent red blood cells 2 020 000 colour index 1 05, the mean diameter of the red cells was 8 μ and anisocytosis poikilocytosis and nucleated red cells were present A test meal showed complete achlorhydria The urine contained pus cells and *B coli* but no sugar or acetone was noted

Treatment by intramuscular liver extract was started and on August 27 the readings were haemoglobin 55 per cent , red blood cells 2 625 000 white cells 5 000 colour index, 1.58 On September 3 the findings were haemoglobin, 62 per cent red blood cells, 3,200 000 colour index 0 96 On this latter date the patient became comatose The urine was found to be loaded with sugar and acetone and the blood sugar was 442 mg per 100 c cm She responded to insulin and glucose given intravenously Subsequently the urine was kept sugar free with doses of 10 and 8 units of insulin daily and at present with 6 units in the morning and 4 at night The blood sugar readings have been 356 246 and 191 mg. per 100 c cm

I am indebted to Dr W Rolland honorary physician and pathologist at Bolton Royal Infirmary for kindly supplying me with his clinical and laboratory findings in this case—I am, etc,

Bolton Oct 2 Harold W Bowyer M B, Ch.B

Aetiology of Erythema Nodosum

Sir—With all due deference to Dr P R Graves (*Journal* October 2, p 681), I feel that his letter giving an account of a small epidemic of erythema nodosum is not quite an adequate reply to mine (September 18, p 599) My description of one case was in no sense written as supporting one theory or another but was offered as a definite example of a case proved as far as possible in favour of one theory, and in an attempt to attract similarly proved cases whatever the conclusions drawn from them

Dr Graves's cases, I would venture to point out hardly approach this standard Tonsillitis *per se* does not necessarily spell streptococci, and the fact that all the cases were in one family might indeed tempt one to suggest that there was a tuberculous taint in the family activated as it often is by some acute infection I do not offer this as an adequate argument but simply to show how debatable is the evidence Dr Graves offers I myself have had other cases which seemed to support one or other aetiological theory but without what one considered to be adequate or conclusive proof—I am, etc

London N 7 Oct 2 W Lees Templeton, M D

Sir—The case of erythema nodosum described by Dr W L Templeton (*Journal* September 18 p 599) presented two features of interest First there were lesions on the face surely this is very uncommon? Secondly, the erythema ran its usual course lasting from a fortnight to three weeks with a gradual disappearance of the lesions although the tuberculous gland, which Dr Templeton regards as the source of the toxin went from bad to worse, until three weeks later it was removed

"THE OMNIPED ELASTIC FOOT CUSHION
is an efficient remedy and a commendable aid to those who suffer from any sort of foot troubles"
States a recent Report from the Berlin Orthopaedic University Clinic

The Omniped Foot Cushion is a resilient cushion which relieves and supports overstrained muscles without producing the pain which is so frequently inseparable from arch supports and foot correctives. With every step Omniped Foot Cushion automatically massages the muscles giving them new strength and gradually easing back the whole structure of the foot to its normal position. Letters from Doctors and relieved patients alike are testifying to the success of this valuable new treatment for fallen arches, metatarsal pains and the various consequent foot troubles. Full information and sample pair will be gladly sent on application

Obituary

SIR JOHN THOMSON WALKER, F R C S

Consulting Urological Surgeon, King's College Hospital

We regret to announce the death on October 5 at Aviemore Inverness shire, at the age of 67 of Sir John William Thomson Walker, the distinguished genito urinary surgeon, who retired from hospital and private practice six years ago and went to live at Goring in Oxfordshire.

A son of the late John H Walker of Newport, Fife, he received his education at Dundee High School the Edinburgh Institution, and the University of Edinburgh where he won medals and prizes in chemistry physiology, gynaecology, and medicine He graduated M B , C M Ed in 1894, took the English Conjoint diplomas in 1896, and the F R C S Eng in 1899 Two years as house-surgeon at the Glasgow Royal Infirmary and the Dundee Royal Infirmary were followed by postgraduate study in Vienna and Jena He then settled in practice as a surgeon in London and was appointed to the visiting staff of St Peter's Hospital for Stone and Urinary Diseases and of the Hampstead General Hospital In 1907 he was Hunterian Professor at the Royal College of Surgeons of England taking as the subject of his lectures 'Renal Function in its Relation to Surgery

In 1919, while still actively associated with St Peter's Hospital and with the Radium Institute as urinary surgeon, Thomson-Walker was invited to the newly created post of senior urologist and lecturer on urology at King's College Hospital His reputation by that time was world wide, more especially in the surgical treatment of prostatic enlargement He at once set to work to form and develop a urological department at King's and throughout his term of office there took the keenest interest in every detail of this work His courteous manner his enthusiasm his great technical skill his patience his kindness generally, and his sympathy with his patients made him universally respected and admired Having effectively organized the department and the teaching of urogenital surgery at King's he resigned from the active staff in 1929 and was elected emeritus lecturer on urology in the medical school and consulting urological surgeon to the hospital During his ten years at Denmark Hill he took a keen interest in the pathological museum and presented to it a large collection of specimens illustrating the pathology of the urinary organs he also gave the medical school a cinema projector and a series of films of urological operations made at the hospital. With Dr Graham Hodgson he designed a new pyelography table which was installed in one of the operating theatres in February 1930 In private practice as in his hospital work, Thomson Walker's personality inspired complete confidence

Sir John Thomson Walker who received the honour of knighthood in 1922 was vice president of the second congress and president of the fifth congress, of the Société Internationale d Urologie In 1921 he presided over the Section of Urology at the Annual Meeting of the British Medical Association at Newcastle in the following year he was president of the corresponding Section of the Royal Society of Medicine in 1926 he was Silvanus Thompson lecturer before the Röntgen Society, and in 1930 delivered the Lettsomian lectures before the Medical Society of London of which he was elected president in 1933 His international repute was shown by the honorary membership conferred upon him by the urological societies of America, France Germany, Austria Spain Portugal and Hungary, and of the Academy of Medicine of Rome He published *Surgical Diseases and Injuries of the Genito urinary Organs* in 1914 and at various times contributed articles on prostatectomy and diseases of the bladder and kidneys to surgical text-books and journals

During the war he held a commission as captain in the R.A M C (T F) and was honorary consulting surgeon to Queen Alexandra's Military Hospital, Millbank, to King Edward VII Hospital for Officers and to the King George Military Hospital For his war services he received the O B.E in 1919 He was also a Deputy Lieutenant of the City of London

W ST CLAIR SYMMERS M B C M

Emeritus Professor of Pathology and Bacteriology Queen's University Belfast

The death occurred at his home in Wellington Park, Belfast on October 4, of Professor W St Clair Symmers after a long illness His passing leaves a great blank in the medical profession in Belfast where his pleasing and striking personality had won for him universal respect and admiration Dr Symmers came to Belfast as successor to Professor Lorrain Smith in the Musgrave chair of pathology in 1904 holding this office till 1929 when he retired and was accorded the title of professor emeritus It is possible that his experience of life in different countries contributed to the development of his charm and wide outlook and his great knowledge of men and things, but this was supplemented by his study of classic works of literature and philosophy In his later years he delighted in the study of Virgil and of the works of this author he had a valuable collection

The son of George Symmers of Huntly Aberdeenshire William St Clair Symmers was born at Columbia South Carolina on January 4 1863 and his boyhood was spent in that State From America he proceeded to the University of Aberdeen where he graduated M B C M in 1887 After a short period of general practice he was assistant pathologist at the Royal Infirmary Aberdeen pathologist to the Birmingham General Hospital and the Lancashire County Asylum Manchester and resident medical officer of the West Brompton Hospital Bacteriology claimed his attention and for nine months he studied at the Pasteur Institute in Paris and was then appointed assistant bacteriologist to the British Institute of Preventive Medicine (now the Lister Institute)

In 1897 he was placed by the Crown in the chair of pathology and bacteriology in the Government Medical School at Cairo and appointed pathologist to the Government Hospital Kasr-el Ainy Cairo He instituted the pathological museum of the Cairo Medical School and supplied it with about 600 preparations collected and mounted by himself While at Cairo he rendered the country a notable service A serious outbreak of cattle plague having occurred in Egypt he was entrusted by the Government with the foundation and direction of an

professor of experimental psychology in the University of Copenhagen at Bedford College for Women Regent's Park N.W. on November 23, 24 and 26 at 5.15 p.m.

Admission to the above lectures is free without ticket.

The Fawcett Lecture on "Elizabeth Garrett Anderson, M.D." will be given by her daughter Dr. Louisa Garrett Anderson at Bedford College for Women, Regent's Park, N.W. on November 25 at 5.15 p.m. Admission is free by ticket obtainable on application to the secretary.

The Schorstein Memorial Lecture will be delivered by Professor Arthur Ellis at the London Hospital Medical College *on Thursday, October 21, at 4.15 p.m.* A postgraduate course for old students will be held from October 20 to 23.

The following appointments to the Faculty of Medical Sciences are announced:

DEPARTMENT OF ANATOMY AND EMBRYOLOGY.—Mr. A. Pollitt, Mr. A. G. M. Weddell, Mr. J. J. Pritchard and Mr. R. E. Norrish as demonstrators.

DEPARTMENT OF PHYSIOLOGY, PHARMACOLOGY AND BIOCHEMISTRY.—Dr. L. Young and Mr. D. H. Smyth as lecturers. Dr. A. L. Chute as temporary lecturer, and Dr. J. H. T. Lawton and Dr. H. O. Schild (pharmacology) as demonstrators.

UNIVERSITY OF SHEFFIELD

At a meeting of the University Council held on October 8, Mrs. Helen Mellanby, B.Sc., Ph.D., was appointed part-time demonstrator for medical and dental students in the Department of Zoology. The Council accepted with regret the resignation of Dr. E. S. Duthie of the post of demonstrator in pathology. Notification was made of a grant of £400 per annum by the Yorkshire Council of the British Empire Cancer Campaign for a research assistant in the Department of Pathology.

The following candidates have been approved at the examination indicated:

FINAL M.B., CH.B.—*(Parts II. and III.)* R. Cuddeford, N. Exell, I. Kossack, C. J. Wells, S. Wolfson.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

Museum Demonstrations

The autumn course of museum demonstrations in the theatre of the College commences on Monday, October 18, when Mr. L. W. Proger will show pathological specimens in the museum. Mr. Proger will demonstrate specimens on October 25 and November 1; also Mr. A. J. E. Cave will discuss the anatomy of the pelvic floor on October 22, the surgical anatomy of the middle ear on October 29, and the anatomy and physiology of the thyroid gland. All the demonstrations commence at 5 p.m. and are open to advanced students and medical practitioners.

The Services

Surgeon Captain F. C. Wright, from the Royal Naval Hospital, Plymouth, has been appointed to command the hospital ship *Maine* in succession to Surgeon Captain W. Bradbury, C.B.E., D.S.O.

R.A.F. VOLUNTEER RESERVE (MEDICAL BRANCH)

The Air Ministry announces that a new branch of the Royal Air Force Volunteer Reserve is to be established for medical officers as a reserve for the reinforcement of the Royal Air Force in times of national emergency. The initial period of service will be five years. Candidates will normally be entered in the rank of flying officer and will be eligible for promotion to flight lieutenant after two years' approved service. Officers will be required in their first year of service to attend an Air Force unit for eighteen working days' training in the duties of a medical officer. In subsequent years they will be liable if called upon to attend for twelve working days annually. They will receive a retaining fee of £15 a year and the pay and allowances of their rank during periods of training. There will be an outfit allowance on entry of £25. Applications are invited immediately from suitable candidates who must be qualified to practise medicine and surgery, be registered under the Medical Acts in force in the United Kingdom and be below the age of 40. They should be sent to the Secretary, Air Ministry (S.7.c), Kingsway, London, W.C.2.

Medical News

At a meeting of the Royal Australasian College of Surgeons held in Melbourne on September 3, honorary Fellowship was conferred upon Professor G. Grey Turner.

At the annual dinner given by the president and council of the British College of Obstetricians and Gynaecologists on *Friday, October 22* at *Claridge's*, the official guest will be the Chancellor of the Exchequer, Sir John Simon.

The annual dinner of the Chelsea Clinical Society will be held at the Hotel Rembrandt, Thurloe Place, S.W., on Tuesday, October 19, at 8 p.m. president's reception at 7.30 p.m. The Earl of Athlone, Mr. H. L. Eason, Principal of London University, and Sir Ernest Graham-Little will attend as guests.

The annual dinner of the past and present men students of the Leeds School of Medicine will be held at the Great Northern Hotel, Leeds, on Thursday, November 25 at 7 for 7.30 p.m., when Dr. J. Le F. C. Burrow will preside. Applications for tickets (10s. 6d. each exclusive of wine) should be made to the Dinner Secretary, the Medical School, Leeds, 2.

The XXVI. Long Fox Memorial Lecture will be delivered in the large theatre of the Wills Physics Building (Royal Fort), Bristol University, by Mr. V. B. Green-Armytage on Tuesday, October 19, at 8.30 p.m. His subject is "The Debt of Western Medicine to the East." The lecture is open to the public and suitable for a non-medical audience. No tickets are required.

A meeting of the Royal Microscopical Society will be held at B.M.A. House, Tavistock Square, W.C., on Wednesday, October 20, at 5.30 p.m., when a paper will be read by Major G. Burrard on "The Microscope in the Identification of Firearms."

A reception will be held at the Royal Society of Medicine on Friday, October 29, at 8.30 p.m., when Fellows and their friends will be received in the library by the president, Sir John Parsons. At 9.15 p.m. Mr. Philip *Guedalla will deliver the Lloyd Roberts Lecture on* "The Method of Biography." Admission will be by ticket only. Applications should be addressed to the secretary and will be dealt with in strict rotation.

Sir Arthur MacNalty will deliver his presidential address on "The Epidemiology of Encephalitis Lethargica" before the Section of Epidemiology and State Medicine at the Royal Society of Medicine on Friday, October 22, at 8.15 p.m.

The third Congress of the Italian Society of Anaesthesia and Analgesia will be held at Turin on October 22, when the following subjects will be discussed: (1) Anaesthesia in injuries of war and peace; (2) Effects of anaesthetics on the central and peripheral nerve fibres and nerve cells. The secretary of the congress is Professor G. Giordanengo, Corso Re Umberto, Turin.

Dr. W. S. C. Copeman, honorary medical secretary of the Empire Rheumatism Council, has been appointed by the Prime Minister to represent H.M. Government at the forthcoming Budapest Congress of Balneology and the bicentenary of the Royal Hungarian Medical Society.

Dr. Hans Virchow, emeritus professor of anatomy at Berlin and eldest son of the celebrated pathologist, was 85 years old on September 10.

The Westminster Hospital announces that six grammes of radium are now in use day and night, at its Radium Annexe, Fitzjohn's Avenue, Hampstead. Four were installed a year ago in a new tungsten bomb; two recently lent by King Edward's Hospital Fund have been added to the equipment and made available for treatment by the reconstruction of the gold-collared leaden bomb formerly used.

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER C M G A D C.

Medical Superintendent DANIEL F RAMBAUT M A M D

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

295 Adie's Syndrome

G BERGMARK (*Nord med Tidskr* July 24 1937, p 1169) draws attention to the frequency with which Adie's syndrome is demonstrable and to the necessity for distinguishing it from tabes with an Argyll Robertson pupil Since Adie's first publication, in 1932 of a paper entitled Tonic Pupils and Absent Tendon Reflexes A Benign Disorder *sui generis* etc.,' there have been more than 100 cases recorded in the literature, and Professor Bergmark alone has observed sixteen cases These he records in detail pointing out that even when there is a history of syphilis it does not follow that the diagnosis of Adie's syndrome should necessarily be put aside in favour of that of late syphilis of the central nervous system Among the components of this syndrome is a pathological pupil reaction, the most important element of which is a myotonic condition demonstrable on accommodation the pupil on the affected side contracts on near vision more slowly than does the pupil on the opposite side, and it also dilates more slowly The affected pupil does not usually react to direct or indirect light but it may do so in an abnormal fashion Certain tendon reflexes are absent or diminished, but there are no motor or sensory disturbances, nor definitely demonstrable changes indicative of disease of the nervous system The cerebrospinal fluid is normal, and the Wassermann reaction is negative In the author's opinion Adie's syndrome is comparable with orthostatic albuminuria in that both conditions are harmless and that their discovery may do more harm than good if they are confused with syphilis and tabes on the one hand and with organic renal disease on the other

296 Arthritis and Chorea in Diphtheria

H G HABER (*Mschr Kinderheilk* July 14, 1937, p 332) states that during the past year out of 435 cases of diphtheria admitted to hospital five showed symptoms of arthritis or chorea The first was a girl, aged 9 with no previous history of polyarthritis who on the twelfth day after injection of serum developed a painful swelling of the joints without any cardiac involvement The second case was a boy, aged 8 with a history of an attack of polyarthritis and endocarditis a year previously who on the seventh day of faucial diphtheria developed polyarthritis without any exacerbation of his pre-existent endocarditis The third child was a girl aged 9 who developed acute arthritis of the right hip with slight thickening of the thigh in the sixth week of diphtheria without any cardiac involvement The fourth case was that of a girl aged 10 who developed symptoms of chorea, which persisted for eleven weeks in the middle of the third week of diphtheria A pre existing heart disease was not aggravated by the chorea and no symptoms of polyarthritis developed The fifth case was that of a girl aged 13 who developed symptoms of acute rheumatism and cardiac involvement in the middle of the fourth week of a mild attack of diphtheria In the thirteenth week a fortnight after the subsidence of the arthritic and cardiac symptoms chorea appeared but cleared up after two weeks treatment by luminal

297 Diabetes Complicating Tuberculosis

M NICOLAI (*Z Tuberk* 1937 78 3 p 159) draws attention to the fact that the prognosis in cases of coexistent diabetes and tuberculosis is since the introduction of insulin by no means hopeless In certain cases in which the sugar metabolism has been brought under control there appears to be a definite tendency for the tuberculous lesion to heal Four cases are described in detail, in two of which unilateral artificial pneumothorax was performed, in one excision of the phrenic nerve was done in addition and in one a bilateral artificial pneumothorax was carried out In each case the daily intake of from 200 to 300 grammes of carbohydrate was easily controlled by insulin of which from 70 to 90 units were given Proteins and fats were cut down to 70 grammes daily Blood sugar curves were estimated each day to prevent hypoglycaemia and other complications Although at the beginning of treatment the prognosis in each case appeared to be hopeless the patients were finally discharged and allowed to resume their former occupations

Surgery

298 Prostatic and Uterine Ballotement

H SCHAFER (*Zbl Chir* July 31, 1937, p 1814) points out that 1,000 to 1,500 c cm of fluid must be present in the abdomen before its presence can be diagnosed by the ordinary methods of percussion and palpation In order to appreciate the presence of smaller quantities than this he recommends that a finger be introduced into the rectum until it just touches the cervix or the prostate The fingers of the other hand are then used to perform small pushing movements on the abdomen just above the symphysis pubis These movements displace the fluid in the pelvis, which in its turn produces a slight ballotement of the uterus or prostate which can be felt by the finger in the rectum The two main sources of error are a full bladder or fluid content in the intestine, and when these are ruled out the author states that his method has given excellent results in diagnosis

299 Hirschsprung's Disease

A W ADSON (*Surgery* June, 1937 p 259) defines Hirschsprung's disease as one of neurogenic origin in which the mechanism for filling the intestine or for retaining intestinal content overbalances the emptying mechanism and causes retention of faeces in the dilated and hypertrophied colon The patients are usually children or young people Acquired megacolon results from chronic obstruction as a result of elongation of the mesentery torsion of a colonic segment or the multiplication of the intestinal loops In the congenital type of megacolon the left half or sometimes the entire colon is enlarged without the presence of any obstructing lesion Thickening of the musculature appears to be a compensatory response intended to overcome the obstruction whether neurogenic or mechanical In mild cases of Hirschsprung's disease the symptoms may be only those of abdominal distension and infrequent defaecation but in more severe forms marked abdominal distension with flaring of the ribs respiratory and cardiac embarrassment and toxic symptoms with absence of spontaneous defaecation may occur The toxic symptoms result in general malaise loss of appetite emaciation and irritability In mild cases medical treatment may control the condition and diathermy gives temporary relief For severe cases lumbar sympathectomy has replaced major operations such as appendicostomy colostomy enterostomy and partial colectomy which were attended by a high mortality and often failed to give relief The type of sympathectomy must depend on the degree of the disease and a procedure should be planned to include sufficient sympathetic fibres to balance the neuromuscular mechanism of filling and emptying the colon The results of operation are given in a series of twenty two cases of Hirschsprung's disease and eight of

STAMMERING SPEECH DEFECTS

BEHNKE METHOD. Estab. 1880. Cases non-resident treated at 39 Earl's Court Sq., S.W.5, and in residence in the Summer holidays at MISS BEHNKE'S house on the Chilterns. "Pre-eminent success in education and treatment of stammering and other speech defects."—*Times*. "Thoroughly physiological principles."—*Lancet*. "The method is scientifically correct and perfectly effective"—*Guy's Hospital Gazette*.

Stammering, Cleft Palate Speech, Lisping 5/9 of MISS BEHNKE, 39 Earl's Court Sq., S.W.5

a considerable extent according to individual response, such a method is greatly preferable to rigid dosage according to body weight, and requires considerably less of the anaesthetic Six cases only required 5 c.cm., but five of these were early cases in which quicker injection was used Three cases required a supplement of ether, and one instance only of collapse was noted—in a mongol aged 1½ Sleep for ten to thirty minutes after operation was the rule The advantages noted include absence of abundant mucous and salivary secretion, and of post-operative vomiting and headache absolute starvation before operation was not found necessary

307 Anaesthesia Affecting the Newborn

S H CLIFFORD and F C IRVING (*Surg Gynec Obstet* July, 1937, p 23) point out that modern methods of obstetric analgesia, which usually depend on a combination of various agents, though very often successful are seldom without some unfavourable effect on the foetus During the past five years the barbiturates have been increasingly used in the Boston Lying in Hospital with terminal gas oxygen or gas-oxygen-ether, and the figures for stillbirths and neo natal deaths have both fallen as compared with the previous five years Since 1931 nembutal has practically replaced amytal In order to avoid the many other factors which may influence the condition of the foetus at birth the authors have studied comparable groups of normally delivered full term vertex presentations A control group of fifty three received no analgesics the remaining 410 had one or more of the basal analgesics, and gas-oxygen with often a little ether at delivery Only two infants died both in the group of seventy five cases which received omnopon and the authors stress the danger of opium derivatives, which they consider should not be used here Of mothers receiving barbiturates 78 per cent had complete amnesia compared with 34 per cent of those who had omnopon or morphine while in the former group 63 per cent. of the infants were physiologically normal and only 3 per cent required resuscitation, against 43 per cent and 23 per cent respectively for the latter group No relation could be shown between the time of administration of the barbiturates and any action on the foetus though with the opiates this effect rose steeply from two hours to a peak at from four to six hours before delivery, falling after eight to ten hours In contrast again to morphine no relation could be shown between the dosage of barbiturate used and the behaviour of the infant The addition of scopolamine to barbiturates gave more successful anaesthesia and analgesia than did that of rectal ether or paraldehyde and none of these combinations showed unfavourable effects on the foetus Nitrous oxide oxygen is considered harmless if given for five minute periods but dangerous foetal anoxaemia may result if 90 per cent or more of gas is given for longer periods The amount of ether used averaged less than one ounce and it was considered to have no effect on the foetus

308 Anaesthesia for Spinal Fractures

P MARIQUE (*Scalpel* Liége July 17 1937 p 1023) describes his method of treatment for fractures of the lower dorsal and lumbar vertebrae The question of anaesthesia for these procedures is fully discussed and reference is made to Watson Jones who in a series of eighty cases was able to reduce the fracture after an injection of morphine without any anaesthetic General anaesthesia is not recommended on account of the danger of pulmonary complications which may develop if a patient lies in a state of narcosis in a plaster jacket Spinal anaesthesia is only suitable for low fractures of the spine Various forms of local anaesthesia are discussed and infiltration of the vertebral muscles with 15 to 20 c.cm of a 1 per cent solution of novocain on each side is recommended this gives an excellent anaesthesia after eight to ten minutes The solution diffuses over the site of the fracture and reduces relaxation of the muscular spasm, so that reduction can be carried out painlessly

309 Headaches after Spinal Anaesthesia

M MARGOTTINI (*Policlinico* Sez. Prat, July 19 1937, p 1385) reviews the literature and records his observations on 3 542 administrations of spinal anaesthetics in the San Giovanni Hospital at Rome from August 1933, to August, 1936 No deaths were recorded The anaesthetic employed was a 10 per cent solution of novocain, which the author regards as the best anaesthetic for the majority of lower abdominal operations After making a trial of the various methods for the prevention and cure of post-anaesthetic headache, which is much commoner in women than in men he found that the intrathecal injection of a 1 per cent solution of glucose after injection of the anaesthetic lowered the incidence of headache to 2 8 per cent and reduced its duration and severity

310 H KOSTER L KASMAN and A SHAPIRO (*Arch Surg* Chicago July, 1937, p 148) classify the various causes of the headache which may follow spinal anaesthesia under three headings (1) seepage of cerebrospinal fluid after spinal puncture, (2) irritative meningitis and (3) contamination of the material injected, causing irritation of nerve tissue In order to obtain information regarding the latter experiments were made in which the solution of procaine hydrochloride in cerebrospinal fluid was contaminated by the addition of tincture of iodine and a solution of trinitrophenol A comparison was also made of the effect of using procaine hydrochloride dissolved in a physiological saline solution tap water, and distilled water with procaine hydrochloride dissolved in cerebrospinal fluid The experiment was conducted in five parts with twenty-five patients in each group and the results showed that neither the addition of tincture of iodine nor the addition of trinitrophenol to procaine hydrochloride dissolved in cerebrospinal fluid had any effect on the development of post operative headache Hypotonicity or hypertonicity as occasioned by using tap water a saline solution or distilled water did not appear to be a factor in the production of headache It was seen from the tables of the five groups that five patients had post-operative headache, and this figure coincides with that of 5 per cent which is the ordinary incidence of these headaches

311 Chloroform

D KULENKAMPFF (*Schmerz Narkose anaesth* August 1937 p 78) states that the dangers of chloroform as an anaesthetic have been exaggerated because unknown concentrations of it have been used too large doses have been given for the sake of deep narcosis and the psychological and constitutional side of the problem has been neglected He points out that experience has long taught that women in labour and accident cases bear the administration of chloroform well since in both instances there is no fear of an anaesthetic It is important to set the patient's mind at rest especially in those cases in which there is a constitutional tendency to spasm and allergy The dose of chloroform can be accurately determined by the drop method and local anaesthesia decreases the amount of chloroform required in a major operation Respiratory disturbances are more dangerous than in ether narcosis but chloroform may be used with advantage in operations about the mouth Its non inflammable properties enhance its value The author recommends anaesthesia which is begun with ether and small quantities of chloroform, together with local anaesthesia of the skin and deeper structures When in a major operation deep narcosis is avoided the patient awakes easily there is no post operative vomiting, and his recovery is pleasanter

HIS MAJESTY'S COLONIAL SERVICE

COLONIAL MEDICAL SERVICE.

It is anticipated that not less than 10 vacancies for Medical Officers will occur before the end of 1937 The majority of these will occur in Tropical Africa and in Malaya

QUALIFICATIONS—Candidates must be British subjects of European parentage, under 35 years of age, and must possess a medical qualification registrable in the United Kingdom Preference will be given to candidates who have held Hospital or Public Health appointments or who have special knowledge of anaesthetics radiology, surgery, medicine ophthalmology, gynaecology and midwifery, diseases of the ear nose and throat venereal diseases, etc

SALARY—Initial salaries vary from £600 to £700, and rise by increments to a maximum of between £1,000 and £1 200

PRIVATE PRACTICE—Private practice is not allowed as of right, but in the case of some appointments it is permitted on certain conditions

QUARTERS.—In Tropical Africa, free quarters, or an allowance in lieu, are provided In Malaya, quarters are provided at an annual rental not exceeding 6% of an officer s salary

PASSAGES—Free first-class passages are provided on first appointment and when returning from leave. Assistance is also given towards family passages

TERMS OF APPOINTMENT.—The appointments are pensionable, subject to a probationary period which varies from two to three years

COURSES OF INSTRUCTION IN TROPICAL MEDICINE AND HYGIENE—Selected candidates will normally be required to attend a course of instruction leading to the Diploma in Tropical Medicine and Hygiene before proceeding overseas

DUTIES—Although Medical Officers are appointed in the first instance for general service, there are opportunities for work in special branches of medicine and surgery, in public health, and in medical research

Further particulars and forms of application may be obtained from the **Director of Recruitment (Colonial Service), 2, Richmond Terrace, Whitehall, London, S W.1**

LANCASHIRE MENTAL HOSPITALS BOARD

APPOINTMENT OF DEPUTY MEDICAL SUPERINTENDENTS

Applications are invited for the following whole time appointments

DEPUTY MEDICAL SUPERINTENDENT County Mental Hospital Lancaster

DEPUTY MEDICAL SUPERINTENDENT County Mental Hospital Winwick

The salary in respect of each appointment is £750 per annum rising by annual increments of £25 to a maximum of £850 An additional £50 per annum will be paid for the possession of a Diploma in Psychological Medicine

The appointments will be subject to the provisions of the Asylums Officers Superannuation Act 1909

Applicants are required to submit their applications on a form to be obtained from the undersigned and such applications endorsed " Deputy Medical Superintendent Lancaster/Winwick as the case may be, should be sent to or delivered at my office not later than 12 noon on Thursday November 4th 1937

BOROUGH OF SOUTHALL

APPOINTMENT OF MEDICAL OFFICER OF HEALTH

The Council invite applications for the above appointment from duly qualified and registered Medical Practitioners who in addition to the qualification prescribed by any Statute are also registered in the Medical Register as holding a Diploma in Sanitary Science, Public Health or State Medicine

The appointment will be subject to the provisions of the Local Government Act 1933 the Sanitary Officers (Outside London) Regulations 1935 and the approval of the Minister of Health

The person appointed will be required to perform all the duties imposed on a Medical Officer of Health under relevant Acts and Orders to act as Medical Officer to the Maternity and Child Welfare Centres, and Medical Superintendent of the Isolation Hospital so long as this continues to be maintained by the Council and will also be required to carry out such other duties of a like nature as the Council may with the consent of the Minister of Health (where necessary) from time to time direct

The person appointed will be required to reside within the Borough and to devote his whole time to the duties of the office. He will not be permitted to engage in private practice.

The inclusive salary attaching to the office will be £800 per annum rising (subject to satisfactory service) by annual increments of £50 to a maximum salary of £1,000 per annum together with a car maintenance allowance of not less than £50 per annum

All fees receivable in respect of any duties carried out by the Medical Officer of Health must be paid into the Council's accounts.

The Local Government and Other Officers Superannuation Act, 1922, has been adopted and the above-mentioned post designated for superannuation purposes and the successful candidate will be required to pass a medical examination by the Council's Medical Office of Health and to contribute to the Council's Superannuation Fund

The person appointed will be required to give three months notice to determine the appointment

Applications stating age, qualifications and experience accompanied by copies of three recent testimonials, must be delivered to the undersigned not later than October 27th 1937

The canvassing of any member of the Council by or on behalf of any candidate for the above mentioned appointment is prohibited and will result in the disqualification of that candidate and each candidate is required to state in his application whether or not he is related to any member or Chief Officer of the Council

PROSTATIC ENLARGEMENT

AND URINARY DISORDERS OF PROSTATIC ORIGIN

Urinary retention is due in the first place to the enlargement of the gland but both the congestive and spasmodic factors must be taken into consideration as they in themselves can cause as much obstruction as the simple enlargement

The progress of adenomatous enlargement is slow yet the symptoms of urinary disorder frequency difficulty and retention show no constant relationship between the increase in the size of the gland and the phenomena of retention

SEDOPROSTYL is a preparation which embraces all three causes of obstruction and the many excellent results now placed to the credit of SEDOPROSTYL have amply repaid the work of those Urologists who devised the formula

YES

YOU CAN SAFELY PRESCRIBE THIS TEA FOR ALL YOUR PATIENTS

Not because it is specially prepared in any way whatever, but simply because it is harmless to the most delicate digestion The Doctor's China Tea is a blend of the choicest teas that China grows—teas which contain comparatively so little tannin that they can be enjoyed by all For over a quarter of a century The Doctor's China Tea has been recommended by the medical profession—even in cases of dyspepsia and gastritis A generous free sample will be sent to any doctor who would like an opportunity of trying the tea

THE DOCTOR'S CHINA TEA

Priced at 2/10, 3/4, 4/, and a super quality at 4/6 per lb

BRONCHOSPASM AND ASTHMA

A booklet surveying this subject, which includes diagrams and illustrations, has recently been published and has been sent to all members of the Medical Profession. You are invited to send for a copy should this have failed to reach you.

"THE LANCET" writes (28/4/34, p 929) —

"We have received a pamphlet on 'Bronchospasm and Asthma,' written to bring before the medical profession the value of Felsol in the treatment of asthmatic subjects The powders can be prescribed by the medical man in accordance with the definite regime which he decides to adopt in the treatment of a case, the claim for felsol being that its administration relieves promptly the attack of asthma by its influence over bronchial spasm, so that only the most severe cases would require the injection of morphia

ROYAL AIR FORCE MEDICAL SERVICE

Applications are invited from medical men for appointment to commissions in the Medical Branch of the Royal Air Force for entry in January, 1938

Candidates must be of pure European descent They must be British Subjects, the sons of British Subjects and registered under the Medical Acts

Candidates must be under *31 years of age* on the 3rd January, 1938, and will be selected after interview by a selection board without competitive examination

Hospital appointments held since qualifying will, under certain conditions, qualify candidates for antedate of commission up to a maximum of one year, the age of entry may, if necessary, be increased by a period equal to the "antedate."

Selected candidates will be appointed to short service commissions (for 3 years extendible to 5 years) followed by 4 years' service in the Reserve, and will be eligible to be considered for Permanent Commissions during their second or third year of service Officers not selected for permanent commissions receive gratuity as follows, on transferring to the Reserve—

On completion of 3 years—£400
On completion of 5 years—£1,000

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, also form of application, may be obtained on application from—

The Secretary,
Air Ministry (D.M S),
Adastral House,
Kingsway, W C 2

Completed applications from intending candidates for the vacancies in January, 1938, must be received in the Air Ministry not later than the 15th of November, 1937

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in January, 1938

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post Graduate study

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, may be obtained from the Medical Director General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than November 22nd, 1937

OVALTINE

AN AID TO HEALTHY DEVELOPMENT

MODERN medical research makes it increasingly clear that abnormalities of form, mental defects and even permanent constitutional weakness, are often a direct result of failure to obtain in infancy a diet adequate to the physiological needs of the organism The basic necessity, therefore, in constructing the dietary of the infant and growing child is to ensure one that is complete in all the essential food elements

"Ovaltine" finds one of its most valuable applications in this direction Composed of the nutritive constituents of fresh full cream milk eggs and malt, in well-balanced proportions, it supplies calcium, phosphorus vitamins and other accessory food factors, and its regular addition to the ordinary diet of the child renders this safe and adequate

"Ovaltine" is so delicious and easily digested that it can be prescribed with complete confidence for children of all ages "Ovaltine" is easily prepared and is most economical

"The decline in the use of cereals... has been associated with the remarkable rise in the consumption of sugar."

Final Report of the League of Nations Committee on Nutrition — 1937

Here is a state of affairs which every medical practitioner has it in his power to combat

Of all the carbohydrate foods, BREAD stands supreme, economically and physically, as the best energy-food for Man

"Not without warrant" says Professor Graham Lusk, *"is bread considered the staff of life"*

BREAD FOR ENERGY

C.F.H.259

ANAHÆMIN B.D.H.

In the treatment of pernicious anæmia

The first injection of Anahæmin B D H in a case of pernicious anæmia brings about in a few hours a remarkable reticulocyte response, whilst subsequent injections at extending intervals result, as evidenced by the accompanying report, in an early return to normality —

' I have had a striking case of success with Anahæmin B D H I attended a woman showing every symptom of genuine pernicious anæmia Red blood count 536,000, and extreme debility It was impossible to provoke the slightest sign of blood in the hand or leg Initial injection 3 c c, followed by 1 c c two days later, and 1 c c five days later In 10 days the woman was moving about the house freely and eating well, hands and legs a natural flesh colour '

Anahæmin B D H is available in 1 c c and 2 c.c ampoules, also in rubber-capped vials of 30 c c

THYMINIC ACID BASE

URALYSOL

TRADE MARK

FORMULA

Thyminic Acid	0·10
Hexamethylenetetramine Anhydromethylenecitrate	0 50
Hexamethylene Tetramine	2 50
Piperazine Tartrate	0 25
Lithium Carbonate	1·00
Sodium Benzoate	1·00
Effervescent Base	ad 100

DIRECTIONS

One teaspoonful to be taken morning and night in a tumblerful of water

Uralysol, in addition to being a solvent and eliminator of pathological Uric Acid is a powerful urinary antiseptic.

Normally there exists in the body a certain quantity of uric acid which assists general metabolism and after it has played its part is eliminated together with the normal thyminic acid of the organism When however, uric acid is present in excess the body needs additional thyminic acid to supplement the resultant deficit of this normal solvent of uric acid

Uralysol, by its thyminic acid content, supplies the agent necessary to dissolve excessive uric acid

The next step is the elimination of this thyminic uric acid which, being in excess of normal, necessitates treatment by an agent capable of enhancing elimination

Uralysol, by its content of hexamethylenetetramine and lysidin, stimulates the organism to eliminate the pathological uric acid already dissolved by its thyminic acid content.

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron The preparation has none of the disadvantages of Pil Blaud The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided

The 'Jelloids' are highly effective in the treatment of achlorhydric anaemia and indeed in all the simple anaemias in which massive iron therapy is indicated.

Iron Jelloids

You are cordially invited to apply for samples for clinical test.

Why the filter tip?

In every "du Maurier" cigarette you will find the filter tip It is a five-layer protection—three layers of pure white vegetable tissue alternating with two of cellulose fibre No irritant that might harm a sensitive throat can get through that No stray "bits" can worry the throat But there's no stopping the clean flavour of the finest Virginia tobacco

du MAURIER

the perfect cigarette with the exclusive filter tip

TEN FOR SIXPENCE • TWENTY FOR ONE SHILLING

COD LIVER OIL

is the only Liver Oil with a pedigree of proved achievement behind it

. . now available in a PALATABLE, HIGH-POTENCY FORM

The study of Vitamins A and D originated through research into the value of Cod Liver Oil as a builder of constitution—sufficient proof of its long standing as a nutritive food Cod Liver Oil contains nature's Vitamins A and D in their right proportion That is why it is specifically recommended by the Ministry of Health and the League of Nations Nutrition Committee Only its general character has been against it in the past but now we have got over this difficulty We have produced in "SevenSeaS," for the first time, a Cod Liver Oil of fresh pleasant flavour in high potency form

"SevenSeaS" is obtainable in three forms (1) High Potency Oil—four times B P standard, (2) High Potency Capsules containing 5 mm dose of High Potency Oil, (3) Standard B.P Oil. We would like all practitioners to prove "SevenSeaS" High Potency Cod Liver Oil to their own satisfaction Please send to the address below for a free sample

PRICES

HIGH POTENCY OIL (*you only need 5 drops*)	**1/3**	*bottle*
HIGH POTENCY CAPSULES (*25 Capsules*)	**1/6**	„

DESOUTTER

CASE RECORDS

Case No H2354/1673 1936

The patient was suffering from muscular hypertrophy of the right leg, the circumference of the calf being twice, and the ankle nearly three times, that of the sound limb The foot was deformed, necessitating a special shoe, and the patient's walk was most ungainly (Fig 1) At the request of the surgeon, Mr Desoutter examined the patient in hospital before amputation to give his opinion as to —

1 *The best site of amputation in view of the peculiar difficulties of the case*
2 *The prognosis from the points of view of appearance and ability to walk well with an artificial limb*

It was decided to amputate 7" below the knee joint and to remove the hypertrophied muscle on the inner side of the leg Figure 2 shows the great success with which the operation was performed The scar on the inner side of the leg, extending from the end of the stump to just under the knee, seemed at first to need special attention, but by very careful fitting of the artificial limb serious trouble was avoided Careful physical re-education played a large part in the success of this case, and the patient now walks very well and has a natural appearance

BRANCHES IN ALL PRINCIPAL TOWNS

The Original and Standard Emulsion of Petroleum

'Angiers' Emulsion

is made with petroleum specially purified for internal use It is the original petroleum emulsion—the result of many years of careful research and experiment

Bronchitis, Sub Acute and Chronic.

There is a vast amount of evidence of the most positive character proving the efficacy of 'Angiers' in sub-acute and chronic bronchitis It not only relieves the cough, facilitates expectoration and allays inflammation, but it likewise improves nutrition and effectually overcomes the constitutional debility so frequently associated with these cases Bronchial patients are nearly always pleased with this emulsion, and often comment upon its soothing, "comforting" effects

Pneumonia and Pleurisy

The administration of 'Angiers' during and after Pneumonia and Pleurisy is strongly recommended by the best authorities for relieving the cough, pulmonary distress, and difficult expectoration After the attack, when the patient's nutrition and vitality are at the lowest ebb, 'Angiers' is specially indicated because of its reinforcing influence upon the normal processes of digestion, assimilation and nutrition

In Gastro Intestinal Disorders

of a catarrhal, ulcerative, or tubercular nature, this emulsion is particularly useful The minutely divided globules of petroleum reach the intestines unchanged, and mingle freely with intestinal contents Fermentation is inhibited, irritation and inflammation of the intestinal mucosa rapidly reduced, and elimination of toxic material greatly facilitated

Free Samples to the Medical Profession

Cystopurin

The ideal urinary antiseptic for oral administration!

1 Produces no gastric irritation or toxic symptoms

2 Is readily absorbed from the gut and excreted in the urine

3 Causes no renal irritation

4 Renders the urine bactericidal in low concentrations

5 Acts from the renal pelvis downwards

6 Is active in either acid or alkaline urine

7 Perfectly safe for use in febrile conditions

8 Acts on all causative organisms of urinary infections.

PROSTATITIS

From information received —

"The Cystopurin—I had good results in one case. A man of about 64 with a small fibrous prostate, suffering from frequency and retention. Three tablets daily cleared up his symptoms in six weeks except for a little nocturnal frequency, but all pain, straining and scalding had gone He had been on various mixtures before for three months with no result."

"I am very pleased to say that Cystopurin is certainly having satisfactory results with a case of cystitis due to cancer of the bladder I find it also satisfactory in gonorrhoea and prostatitis"

'In a case of chronic prostatitis and cystitis in a man aged 64 Cystopurin greatly improved the condition of urine and frequency of micturition. Patient has had lately very good nights Bacterial examination, no pus in urine.'

I have pleasure in reporting to you on my experience of Cystopurin I have in the past used it in intractable cases of cystitis or prostatitis and have had very good results'

"Male aged 56 This man had delayed coming forward for treatment for about a month and was in a very serious condition He had an acute urethritis with prostatitis and orchitis, the testicle being about the size of an orange His temperature was 103 4° F Pain was extreme and he was afraid to micturate He was put on treatment at once but with very poor results I administered Cystopurin tablets in the dosage of two t.i.d At the end of the third day an improvement was noticed, the temperature having fallen to 100° F The dose was then increased to three t.i.d At the end of a fortnight the prostate was considerably reduced in size and much less tender, and the testicle was nearly normal in size and painless. Progress was thereafter uninterrupted the first negative smear being returned much sooner than was anticipated The dose of three tablets t.i.d. was reduced to one t.i.d when the temperature became normal on the seventh day

"I am sure that this man's illness would have been of much longer duration but for Cystopurin."

Supplied in bulk and in tubes of 20 tablets for dispensing purposes.

GENATOSAN LIMITED, Loughborough, Leicestershire

Nutritional Anaemia

In women, the incidence of anaemia is higher than in men because the physiologic demands for iron during menstruation and pregnancy are not satisfied by a diet which suffices for men Iron must be added.

In Ovoferrin, metallic iron is so combined with a protective protein colloid, as to constitute a most efficient and palatable haematinic

Ovoferrin does not irritate the mouth or stain the teeth, it does not constipate and is readily taken by children and by gravidae with sensitive stomach and nerves

It stimulates the jaded appetite and often induces intestinal peristalsis In old age, Ovoferrin acts as a stimulating general tonic.

OVOFERRIN

Brand Colloidal Iron Tonic

The adult dose—a tablespoonful in milk or water, contains one grain of metallic iron in easily assimilable form, for children, the dose is two teaspoonfuls

Ovoferrin is prescribed in 11-ounce bottles If you have not used Ovoferrin in your practice, we shall be pleased to send you a trial bottle on request.

pursued her through devious but most assured ways till they reached her in the citadel of truth And truly in such pursuits it is sweet not merely to toil, but even to grow weary, when the pains of discovery are amply compensated by the pleasures of discovery It were disgraceful, therefore, with this most spacious and admirable realm of Nature before us, and when the reward often exceeds the promise, did we take the reports of others upon trust Nature is herself to be addressed, the paths she shows us are to be boldly trodden, for thus and whilst we consult our proper senses, shall we penetrate at length into the heart of her mystery"

Harvey on the Stomach

In 1642, whilst Harvey was in attendance on the King, a mob of citizen-soldiers entered his lodgings in Whitehall, stole all his furniture, and scattered his papers, among which were the "Medical Observations" he had been collecting for many years and which he had intended to publish Consequently much of what Harvey wrote is lost, and little is known about his interests in medicine beyond his two great works, *De Motu Cordis* and *De Generatione* But there is a hint in the latter that he was a forerunner of Beaumont, Pavlov, Starling, and Cannon, the pioneers of gastro intestinal physiology, as his observations on the digestion of birds contain without doubt the earliest recorded description of the motor functions of the stomach

Almost all birds are provided [he wrote] with a double stomach, one of which is the crop, the other the stomach, properly so called In the former the food is stored and undergoes preparation, in the latter it is dissolved and converted into chyme In the crop the active grain that is swallowed is moistened, macerated, and softened and then it is sent on to the stomach that it may there be crushed and comminuted For this end almost all the feathered tribes swallow sand pebbles, and other hard substances, which they preserve in their stomachs, nothing of the sort being found in the crop Now the stomach in birds consists of two extremely thick and powerful muscles so placed that, like a pair of millstones connected by means of hinges, they may grind and bruise the food, the place of teeth, which birds want, being supplied by the stones they swallow In this way is the food reduced and turned into chyme, and then by compression the softer and more liquid part is forced out and is transferred to the commencement of the intestinal canal. The stones and other hard and rough substances which the birds have swallowed, if long retained, become so smooth and polished that they are unfit to comminute the food, when they are discharged

'If you apply the body of a hawk or an eagle, or other bird of prey, whilst fasting, to your ear, you will hear a distinct noise, occasioned by the rubbing, one against another, of the stones contained in the stomach."

One can hardly feel surprised that this, one of the earliest recorded observations by direct auscultation, remains unconfirmed to this day in spite of Harvey's remark that "it was disgraceful did we take the reports of others upon trust' The College possesses a reproduction of an imaginative painting of Harvey seated under a hedge reading a book whilst in charge of the Prince, afterwards Charles II, and the Duke of York during the battle of Edgehill I would commend Harvey with his ear applied to the body of a fasting eagle as a pleasing subject for a companion picture Thirty years ago I obtained permission to repeat on a giraffe in the Zoo some observations I was making on the sounds heard on auscultation of the back and epigastrium during swallowing, as I thought that the length of its oesophagus would make their analysis less difficult. However, I had not Harvey's courage, and the experiment is still waiting to be made

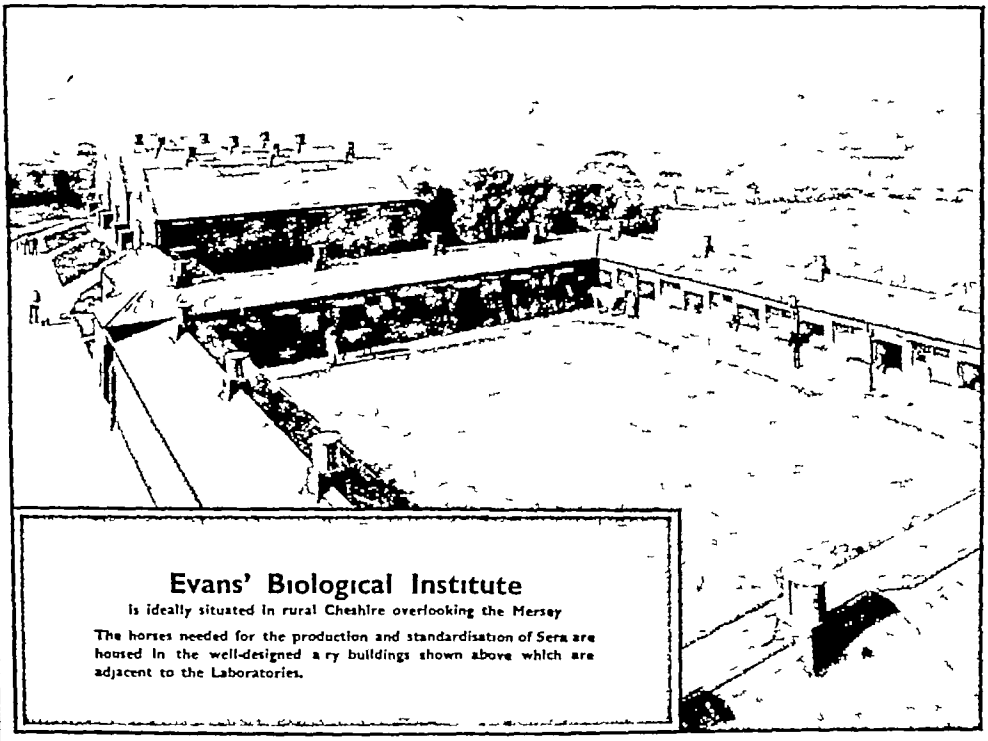
No further observations on the movements of the stomach were made in the two hundred years which followed the publication of *De Generatione* Then in the course of his investigations on Alexis St Martin's stomach Beaumont studied its movements, and in the latter half of the nineteenth century several physiologists investigated the movements and their nervous control in the exposed stomach of animals But in 1897 when I became a medical student at Oxford, the stomach was still portrayed in the textbooks of anatomy as an enormous inert sac hanging across the middle of the abdomen That same year a first-year Harvard medical student, W B Cannon, had the inspiration to render the stomach of cats opaque to the rays recently discovered by Röntgen by adding bismuth salts to the food, a method which was soon to be applied to man as well as to cats, and was to open a new era in the investigation of the physiology and pathology of the stomach by visualizing the gastric movements and so making it possible for every physician to be a Beaumont and every patient an Alexis St Martin

It is clear from the quotation I have given that Harvey regarded the stomach as the organ in which the food is diluted, softened, and broken up in preparation for its absorption from the intestines His work on the circulation of the blood had convinced him that the mesenteric veins convey nourishment from the intestines to the liver and thence by the vena cava to the heart, which distributes it to all parts of the body It is curious, however, that in his old age he refused to accept Pecquet's convincing demonstration that the lacteals, which he had himself observed in the course of his dissections before Aselli had published the first description of them in 1622, were concerned with the absorption of nourishment from the intestines

Harvey's interest in physiology was thus not confined to the circulatory and generative organs, and his observations and experiments on the physiology of digestion were of fundamental importance Instead of tracing the evolution of knowledge concerning the circulation since Harvey's time, as several of my predecessors have done, I propose to describe how the Harveian methods of combined observation and experiment have led to our present knowledge of the functions of the stomach

William Harvey and William Beaumont

In his 52nd Exercise of *De Generatione* Harvey describes the case of a young nobleman, the apex of whose heart, covered by a suppurating membrane, was exposed as a result of an injury he had received as a child In spite of this he was in excellent health and "felt adequate to any exercise or expedition" Harvey describes how he demonstrated to King Charles the movements of the young man's heart, and how in systole the apex emerged and protruded "And his most excellent majesty, as well as myself, acknowledged that the heart was without the sense of touch, for the youth never knew when we touched his heart"



Two hundred years later Alexis St Martin, a young Canadian trapper, received a gunshot wound in the abdomen. He came under the care of William Beaumont, a surgeon in the United States Army, who took him into his own house and for two years nursed him back to health The wound eventually healed, leaving a gastric fistula surrounded by a ring of prolapsed mucous membrane Beaumont, who was endowed with the same spirit of inquiry as Harvey, engaged St. Martin as his servant and for two periods between 1825 and 1833, amounting in all to twenty-four months, made almost

LIVERPOOL and LONDON

working with Minot on the treatment of Addison's anaemia with liver, solved the problem in a manner which would have delighted the heart of Harvey He first demonstrated that the administration of the gastric juice of a normal man had no more effect on the blood of a patient with Addison s anaemia than an artificial gastric juice consisting of hydrochloric acid and pepsin He then made the remarkable observation that a mixture of meat with gastric juice was as effective as liver in the treatment of the anaemia, but that this was not a result of peptic digestion, as the gastric juice could not be replaced by hydrochloric acid and pepsin, and the mixture was most effective when the hydrochloric acid was completely neutralized so as to prevent the occurrence of peptic activity It is now known that the gastric juice contains an intrinsic factor, haemopoietin, which reacts with an extrinsic factor present in meat and in other foods to produce an active principle that is stored in the liver and passes as required to the bone marrow, the normal activity of which depends upon its presence In the absence of this principle the embryonic blood-forming tissue fails to reach maturity and the characteristic blood picture of Addison's anaemia results The history of human physiology since the time of Harvey contains few more fascinating examples of the solution of an apparently insoluble problem by inductive reasoning and experiment

Neuropoietin

In 1922 an Australian Fellow of the College, J R Bell, and I found that achlorhydria is constantly present in subacute combined degeneration of the spinal cord, and that in untreated cases an Addisonian type of anaemia almost invariably develops before death It was at first thought that Minot s discovery of the liver treatment of Addison's anaemia was not applicable to the associated nervous disorder, but Ungley and Suzman, the former a Leverhulme Scholar of the College, have shown that when the dosage is adequate the disease can not only be arrested but great improvement and sometimes complete recovery may be expected to occur As Addison's anaemia and subacute combined degeneration of the cord rarely develop with equal rapidity in the same patient, and in many cases either may be present alone for long periods with no symptom or sign of the other, it seems clear that they must be caused by deficiency in different though closely associated substances Further evidence of this is afforded by the fact that the gastric juice of patients with achlorhydria and subacute combined degeneration of the spinal cord but normal blood can be shown to contain haemopoietin by its curative influence on Addison's anaemia I have suggested that the gastric juice contains an additional ferment, to which the name neuropoietin may be given This is the intrinsic factor which is stored in the liver and is required for the normal nutrition of the central nervous system Its deficiency results in subacute combined degeneration of the spinal cord The gastric juice thus has the surprising function of supplying a substance essential for the nutrition of the central nervous system

It is now known that the proximal half of the stomach secretes hydrochloric acid and pepsin and that the distal half secretes an alkaline juice containing haemopoietin and neuropoietin (Meulengracht) Severe and progressive gastritis leads first to the disappearance of hydrochloric acid then of pepsin, and finally, when the pyloric half of the stomach is sufficiently damaged, haemopoietin or neuropoietin or both are no longer secreted

The stomach is thus an organ of extraordinary versatility It protects the intestines from chemical and mechanical insults by diluting, softening, and breaking up the food, it digests protein and curdles milk, it offers an antiseptic barrier to bacteria from above and below, and it produces substances which are essential factors in the production of the active principles required for the blood forming activity of the bone marrow and for the nutrition of the central nervous system

Human Vivisection

In recent years surgery has offered abundant opportunities for studying the physiology of the stomach in man by means of operations which have often made experiments on animals superfluous Investigations after gastric operations, most of which have been carried out by Fellows and members of this College in co-operation with Fellows of the College of Surgeons, have shown that in spite of its many functions the stomach is not an absolutely essential organ Gastrojejunostomy and, more frequently, gastrectomy may totally abolish gastric digestion by giving rise to achlorhydria, but in spite of this the stools contain no excess of undigested food, and the loss of the protection against mechanical and chemical irritation and of the acid antiseptic barrier of the gastric juice manifests itself by a tendency to diarrhoea in only a small proportion of cases Simple achlorhydric anaemia is, however, a common sequel of partial gastrectomy, but Addison s anaemia is surprisingly rare and does not even develop in every case of total gastrectomy This is now known to be due to the fact that the mucous membrane of the first part of the duodenum, the glands of which are similar in structure to those of the pyloric end of the stomach, secretes a juice containing haemopoietin, the quantity of which is sufficient in most people to compensate for the absence of gastric juice

The interest shown by Harvey and his friend and patron King Charles I in the absence of sensibility of the heart would have been extended to the observations which it is now possible to make on individuals whose stomachs have been completely removed by operation In my Goulstonian Lectures I showed that the mucous membrane of the alimentary tract from the pharyngo oesophageal sphincter to the junction of the rectum with the anal canal is insensitive not only to tactile but also to thermal stimuli, and that the only adequate stimulus to sensation in the stomach and intestines is distension, with the exception of the warm epigastric sensation produced by the introduction of strong alcoholic drinks into the stomach After complete removal of the stomach a patient does not spontaneously appreciate his loss by the absence of any familiar sensation Appetite and the general sensations associated with hunger are unaffected, and, on swallowing, nothing unusual is noticed unless the patient takes his food too rapidly, when he feels some fullness in the epigastrium He cannot distinguish this from what he would have felt under similar conditions before his operation, although presumably it is caused by distension of the part of the jejunum anastomosed with the oesophagus Close observation, however, shows that the feeling of emptiness after long abstention from food is not felt, and the patient does not experience the pleasant glow in the epigastrium which should follow the drinking of neat spirits or a liqueur

In describing the development of our knowledge of the functions of the stomach I have mentioned only a few of the names of those to whom we are indebted for that knowledge It will be observed that the majority of them, especially during the last thirty years, were hospital physicians We see, therefore, that to-day there are still physicians engaged in the practice of medicine who

predisposed by simple hygienic methods cancer too should be prevented, and even if gastritis and gastric ulcer are not abolished their early recognition and adequate treatment should result in their cure before malignant degeneration has had time to occur

Gastroscopy

The fractional test meal has made it possible to investigate the secretory functions of the stomach with considerable accuracy, and the x rays afford a means of studying its motor functions and the deformities produced by disease But so long as the mucous membrane of the stomach remained inaccessible to visual inspection there could be little advance in our knowledge of gastritis, which is now known to be much the most common of all gastric disorders The invention of a flexible gastroscope by Schindler in 1932 may therefore be regarded as a landmark in the study of the stomach in health and disease which ranks in importance with that of the cystoscope in the study of the bladder I am glad that in this country the gastroscope has not suffered the fate of the cystoscope and come to be regarded as a surgical instrument Several of our younger Fellows and members are already expert in its use, and their investigations are adding greatly to our knowledge of the pathology of the stomach If one thinks for a moment how little could be known of glossitis or pharyngitis without inspection of the tongue or pharynx, it is easy to realize how much our knowledge of gastritis is gaining from gastroscopy The interpretation of radiographs of the stomach is being revolutionized, and for some purposes, such as the investigation of post-operative gastric disorders and of the *healing of gastric ulcers under treatment, gastroscopy* must in the future take the place of radiology

Medical Friendship

Harvey desired that the Fellows of the College should live in brotherly love and affection This is best promoted by frequent opportunities of meeting, such as are offered by the four annual dinners of the Fellows' Club I am happy that the feast which Harvey desired should be 'kept within the College on the day of the oration "for all the Fellows that shall please to come,' and towards the cost of which he made on the occasion of the first dinner an endowment of fifteen pounds, is to be revived to night, as it gives an additional stimulus to good-fellowship among Fellows of different generations

Until thirty years ago provincial Fellows too often had to work in most undesirable isolation This is now a thing of the past, largely owing to the good work of the Association of British Physicians; the foundation of which in 1907 we owe to seven former Harveian Orators—Osler, Herringham, Garrod, Rose Bradford, Rolleston, Hale-White, and Robert Hutchison The association also gives London physicians an opportunity of seeing the hospitals and laboratories of other university cities in Great Britain and Ireland, but it is still a blot on London medicine that there is so little intercommunication between the staff and students of the twelve teaching hospitals, in striking contrast with the conditions in the University of Paris where students are free to attend clinics and lectures in any hospital they please Visitors from the Dominions and America generally know more about the methods of teaching and the day-to-day work of the London hospitals than the hospital physicians themselves, who are satisfied to continue their activities in a far from splendid isolation Occasional visits of a physician with his firm to a friend at another hospital is good for both physician and student, as I can testify from my own experience in the last few years and I hope that this practice will become increasingly common

The international relations of the College have in the past been very limited On rare occasions distinguished physicians from abroad have lectured in this room, and during the tercentenary celebrations of the publication of *De Motu Cordis* two of the representatives of the learned societies of the world, Pavlov and Wenckebach were elected Honorary Fellows

In company with a group of Fellows of the College I have in each of the past nine years made a pilgrimage to some foreign medical centre We have been greatly impressed by the kindness with which we have always been received, and by the eagerness that our hosts have shown in demonstrating the work in which they were interested and in hearing about medical research and medical education in Great Britain A direct result of the international co-operation which can follow such meetings is seen in a paper in the April number of the *Quarterly Journal of Medicine* which would never have seen the light had it not been for the 1936 meeting of the Medical Pilgrims In this paper Donald Hunter, Snapper of Amsterdam, and Witts describe a new syndrome of hypogonadism, alopecia, depression of metabolism, microcytic or macrocytic anaemia, subacute combined degeneration of the cord, and achlorhydria They suggest that the syndrome is the result of a lesion of the anterior lobe of the pituitary gland, which must, it is assumed, produce under normal conditions a stimulant to the secretion of haemopoietin How greatly Harvey would have appreciated an investigation of this kind is clear from a letter he wrote to John Vlackveld of Haarlem six weeks before his death

> Nature is nowhere accustomed more openly to display her secret mysteries than in cases where she shows traces of her workings apart from the beaten path nor is there any better way to advance the proper practice of medicine than to give our minds to the discovery of the usual law of nature by the careful investigation of cases of rarer forms of disease."

I should like to suggest that we might follow the example of our sister College and the Académie de Chirurgie of Paris by exchanging visits with the Académie de Médecine Might we not also renew our old associations with the medical schools of Padua and Leyden, where so many of our seventeenth and eighteenth century Fellows received the greater part of their medical education, and with the American College of Physicians, whose Fellowship is open to Canadians as well as to citizens of the United States? We might in these and similar ways do something to extend Harvey's admonition to live in brotherly love and affection beyond the confines of the College to physicians in other parts of the world, and in this way add our small though by no means negligible contribution towards the maintenance of peace by the promotion of international friendship

On St Luke's Day, October 18 1602, the youthful Harvey must have listened to the Oration in Praise of Medicine which every year opened the medical session in the University of Padua I like to think that since his death fifty-five years later his spirit makes an annual pilgrimage to this College on St Luke's Day to listen to the Oration which he founded He would regret the decay of classical education which has led to its delivery in English instead of Latin but he would, I think find no other sign of backsliding Though modest in life his vanity would be flattered by the efforts of a whole series of learned Orators to bring to light everything which can

FOR THE TREATMENT OF SYPHILIS

TRADE MARK

SULPHOSTAB

BRAND

Sulpharsphenamine B.P.

For Intramuscular injection, SULPHOSTAB is the preparation of choice for children and adults SULPHOSTAB is especially valuable in antenatal work and Congenital Syphilis.

Approved by the Ministry of Health for use in Public Institutions

Manufactured under Licence No 19 Therapeutic Substances Act, 1925

DOSES — 0·005 gm to 0·90 gm (24 graduated doses) Supplied in single ampoules and boxes of ten ampoules.

TRADE MARK

BISMOSTAB

BRAND

Injection of Bismuth B.P.

A 20 per cent suspension of Bismuth metal in isotonic glucose solution Administered by Intramuscular or Deep Subcutaneous injection, it forms a depot from which Bismuth is gradually and continuously absorbed over a long period

into the pleural cavity If there are no adhesions artificial pneumothorax is not an unsafe method of treatment

In a series of eight cases of simple abscess which I treated by artificial pneumothorax four patients made a good recovery and are still well In two the abscess ruptured into the pleural cavity, but both recovered after drainage and are now well, in one the symptoms persisted and thoracoplasty was later performed, and in one the patient died after an operation for dividing the adhesions I think, however, that if postural treatment fails it is on the whole safer to employ surgical drainage

Aspiration through a bronchoscope has been performed and several successful cases described This really may be regarded as an additional method of draining the abscess cavity medically, and if used should be combined with postural drainage In certain cases it may be wise to give this method a trial, although if the abscess persists operation should not be too long delayed

Surgical treatment consists in opening the abscess and draining The operation should be performed in two stages, the first is intended to produce adhesions between the chest wall and the pleura over the cavity, and the second to drain the abscess There are definite dangers, and the operation should be regarded as a serious one Haemorrhage may occur later, cerebral abscess is perhaps slightly more common after operation than in cases treated medically, or infection may spread throughout the lung It would appear that as methods of postural drainage improve this will be the treatment of choice in cases of abscess

Intravenous injections of alcohol have been suggested, and 10 c cm of a 20 per cent solution is that most commonly used Sodium benzoate has been recommended for treatment of gangrene and abscess of lung the dose advocated here is 20 c cm of a 20 per cent. solution, increased up to 50 c cm, given daily I have no experience of either of these methods

In cases of gangrene good results have been recorded from an intensive course of treatment with arsphenamine, the object being to kill the spirochaetes which cause the gangrene It is certain that some of the cases in which the sputum is most offensive do quite well on simple medical treatment, and I have not convinced myself that improvement has been due to the arsenic As the spirochaetes are sometimes found in the gums of normal people pre-operative dental treatment has been advocated, and it is claimed that this reduces the pulmonary complications

A new German quarterly journal, *Fortschritte der Erb pathologie Rassenhygiene und ihrer Grenzgebiete* has appeared, it is published by Georg Thieme of Leipzig The joint editors are Dr J Schottky of Hildburghausen and Professor F von Verschuer of Frankfurt-a-M The first issue is dated July, 1937, and in addition to an introductory editorial explanatory note contains an article on the transmission of intelligence and character which is contributed by Dr K Gottschaldt of Berlin, another by Dr Wülker of Berlin on the investigation of natural selection and a third by Dr H Schade of Frankfurt on the biological aspects of heredity As indicated by these opening articles the new periodical should appeal particularly to those who are concerned with the influence of heredity, particularly on the pathological side, racial hygiene, and related topics The annual subscription is 16 RM

A RAPID METHOD FOR ISOLATION OF ORGANIC POISONS

PRELIMINARY NOTE

BY

C. P. STEWART,* S K CHATTERJI

AND

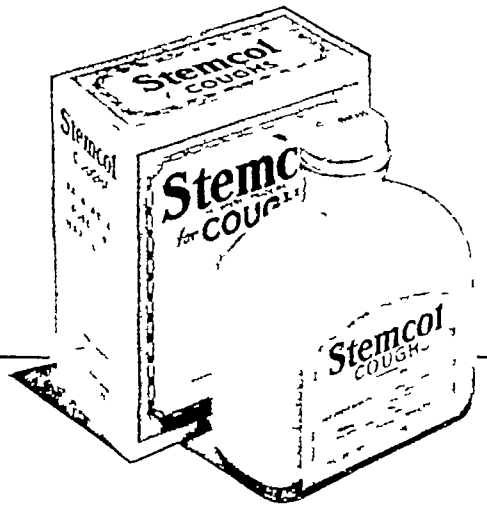
SYDNEY SMITH

from the

Department of Forensic Medicine University of Edinburgh

The standard method for the isolation of organic poisons from viscera, stomach contents, etc, is that described in the majority of medico legal and toxicological textbooks as the Stas Otto process It is a slow, laborious, and often difficult method based on the repeated precipitation of proteins, fats, and similar interfering substances by alcohol, the organic poisons (alkaloids in the form of their salts) being retained in solution Complete removal of the interfering substances involves repeated precipitation, each of which probably causes some loss of the substance sought To minimize these losses thorough extraction of the precipitated material is required, and even with distillation *in vacuo* the evaporation of the relatively large volumes of alcohol (or aqueous alcohol in the early stages) is very time-consuming On the other hand, if the Stas Otto process is carefully carried out there is little likelihood of any of the commoner organic poisons, administered in lethal dose, being missed It is not uncommon, for example, for morphine, given in medicinal doses, to be detected in the viscera post mortem

It is obvious, however, that a shortening and simplification of the extraction process is very desirable, provided it can be achieved without any loss of power to detect very small amounts of poisonous substances An alternative is supplied by Lloyd's process (Sydney Smith, 1936), which consists in preparing an acid water alcohol extract of the material as in the Stas Otto process, and adsorbing any alkaloids present in this extract on fuller's earth Adsorbents at this stage, however, are likely to take up many substances other than alkaloids, and, moreover, we have found fuller's earth to be notably inefficient in the adsorption of alkaloids



Not only alkaloids, but most other poisons usually classed as organic, are of such a chemical nature that one would expect them to be adsorbed by various earths, though not all under the same conditions Hence a hopeful line of attack seemed to be available for the isolation of the poisons once the proteins and fats have been removed, and the problem resolved itself into two parts—(*a*) to find a rapid and safe method of removing such interfering substances as protein, fat, etc with minimal loss of the poisons to be sought, (*b*) to find a suitable adsorbing agent and the conditions required for the adsorption and elution of the different types of poisons

Since our first consideration was the detection of alkaloidal poisons we were concerned primarily with the possibility of adsorption from acid solution and with preliminary treatment which could be carried out completely at reactions below *p*H 7

Precipitation by Trichloracetic Acid

Of the various protein precipitants used in blood analysis some (like zinc hydroxide) function in an alkaline medium, others (like tungstic acid) involve little change in the reaction of the original material, and others again (like metaphosphoric acid or trichloracetic acid) are strongly

* In receipt of a part-time grant from the Medical Research Council

Nujol Laboratories confidently commend this new and efficient medicament

Stemcol

for cough

The Stemcol formula contains nothing revolutionary It embodies expectorants, demulcents and antiseptics long approved by the medical profession What *is* new, however, in Stemcol is the combination of these essential medicaments with Nujol — the standard viscosity liquid paraffin — in a pleasantly flavoured intimate emulsion Stemcol contains no narcotics or sedatives and can, therefore, be prescribed for quite young children and the aged tracheitic or bronchitic patient with full confidence in its efficiency and safety Stemcol has been the subject of a large number of favourable reports in

PHARYNGEAL COUGH
BRONCHIAL COUGH
PERTUSSIS
NIGHT COUGH OF PHTHISIS
TRACHEITIS

Packed in 6-oz bottles - 1/9 each

STEMCO Ltd, Nujol Laboratories, 128 Albert Street, London N W 1

amounts were added to meat and the mixture was submitted to the process as described for strychnine, both alkaloids were readily detected in the final chloroform extract

Experiments with atropine have, so far, been less successful The substance is readily enough adsorbed by kaolin, but, probably because it is so easily hydrolysed, we have never succeeded in obtaining a recovery of more than 50 per cent of the amount added to meat Usually the recovery has been less than this With 10 mg of atropine originally added, however, we have never failed to detect the alkaloid in the final chloroform extract This is disappointing, although the recovery of atropine is notoriously difficult with the standard Stas Otto process Further experiments will, we hope, enable us to obtain better results, and, in particular, experiments are to be made on the extraction of the kaolin without added alkali It is a reasonable supposition that the process, if it can be suitably modified to give good results with the less stable alkaloids such as atropine, will be as satisfactory as the present method in dealing with the more stable ones

Need for Further Tests

It is evident that, although it promises well, the method of adsorption on kaolin requires much further testing and possibly modification in detail before it can be applied confidently to the detection of organic poisons in medico-legal work To be of the greatest possible use it must be applicable to many substances besides alkaloids Into this field we have not yet ventured very far Antipyrine, however (as one would expect from its structure), behaves like the alkaloids Veronal, tested as an acidic substance in contradistinction to the basic alkaloids, is not adsorbed by kaolin, fuller's earth, franconit, or alumina from acid solution, it is however, readily adsorbed by animal charcoal (Merck's carbo medicinalis), especially easily from a warm solution After adsorption on charcoal it is readily eluted by ether, though not by chloroform For the elution the charcoal was moistened with acetic acid and extracted with ether The ethereal extract was filtered to remove suspended particles of charcoal and evaporated The purity of the recovered veronal was shown by determination of its melting-point The recovery varied in different experiments from 75 to 90 per cent of the amount used (20 mg)

When both strychnine and veronal were added to minced meat it was found possible, after treatment with trichloracetic acid, to adsorb the strychnine on kaolin, from which it was later recovered by the chloroform extraction method previously described The trichloracetic acid extract from the kaolin still contained the veronal, which was then removed by adsorption on charcoal and elution with ether Both strychnine and veronal were recovered in good yield and in pure state

Summary

It is shown that in the extraction of alkaloidal poisons from viscera the laborious and time-consuming Stas Otto process may be replaced by treatment of the minced material with trichloracetic acid This at once yields a water-clear filtrate free from protein and fat, and containing the whole of the alkaloid originally present

From this filtrate the alkaloid can conveniently be removed by adsorption on kaolin, from which after neutralization it is eluted by hot chloroform After removal of the alkaloids veronal can be adsorbed on charcoal and eluted with ether

The method is being tested further and extended to other organic poisons

We wish to take this opportunity of thanking Mr J Whittaker senior technician in the biochemical laboratory of the Edinburgh Royal Infirmary who has carried out a number of analyses using the method we have described, and has independently obtained results similar to those reported in this note We have also to acknowledge a grant from the Moray Research Fund of the University, which covered the expenses of the work

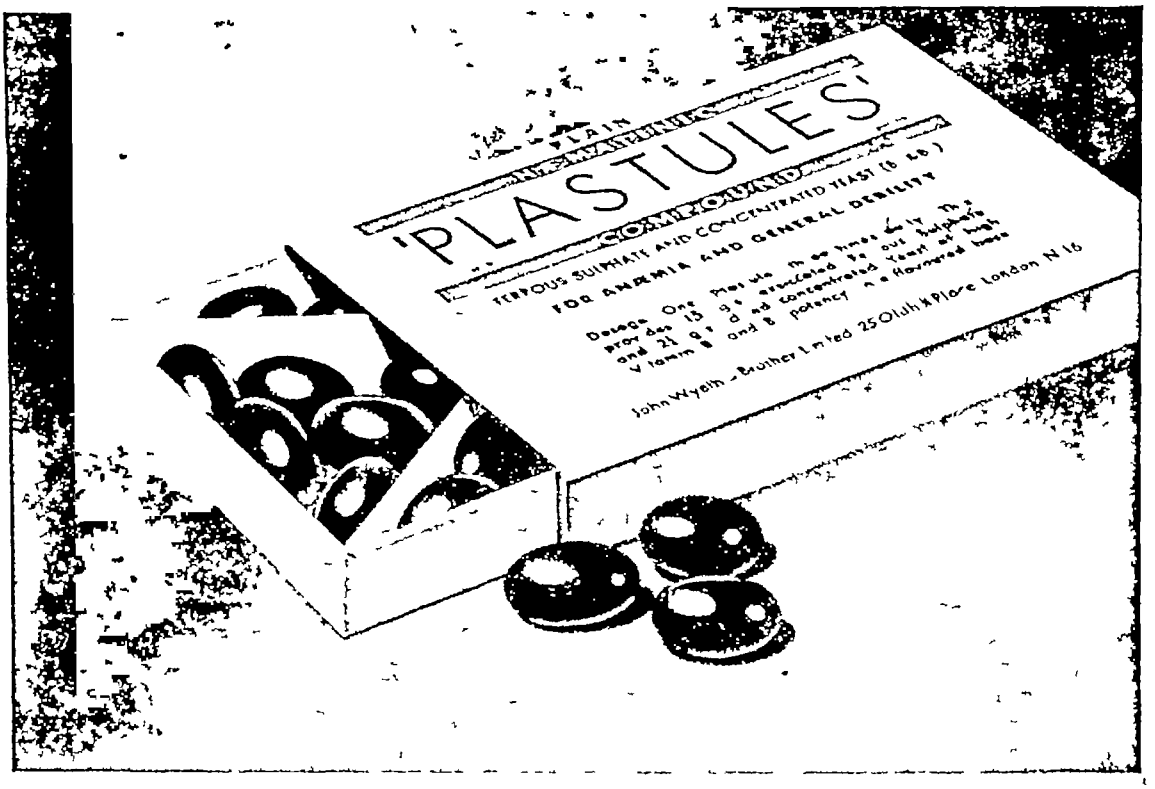
AFFECTIONS OF THE EYE WITH RELATION TO SKIN DISEASES *

BY

J. H DOGGART, M D, F R C.S

Assistant Ophthalmic Surgeon St George's Hospital
Ophthalmic Surgeon Hospital for Sick Children
Great Ormond Street



There is no lack of evidence to prove that the care of skin diseases is in many ways closely linked with ophthalmic practice Some overlapping of these specialized branches of medicine is necessitated by the mere fact that the eyelids are covered by skin, and this skin, like that of the rest of the body, may be afflicted by a large number of different lesions—for example, eczema, gangrene, gumma, and lupus But the amount of actual overlapping is far greater than can be explained by any such simple fact Dermatologists and ophthalmologists have many other reasons for pooling their clinical experience and acknowledging common interests In the first place, the eyelids are one of the favourite starting-points for rodent ulcers and various other diseases, secondly, the skin in this situation is loosely attached and exceptionally sensitive, thirdly, there are certain skin diseases with important eye complications, fourthly, ocular treatment may require to be modified owing to the state of the adjacent skin, and incidentally the eye must be safeguarded in applying certain remedies to the upper part of the facial skin

Oedema of Eyelids

Since they form part of the face and are continually exposed to view, the eyelids are rendered conspicuous by slight changes such as would hardly be noticeable if they occurred elsewhere Their skin, being thinner and more delicate in texture than that of any other part, is remarkable for its rapid distensibility by oedematous fluid Thus in some cases of disordered renal function the eyelids are puffed out in the absence of any evident swelling elsewhere The eyelids also respond with rapid swelling not only to the inflammatory processes involving their immediate anatomical relations, such as styes, conjunctivitis, or acute infection of the tear sac, but also to abscesses that are, relatively speaking, remote *One case recently sent for ophthalmic treatment* was a boy whose right eyelids showed considerable oedema Noticing that the whole of his right cheek was unduly prominent, I asked him to open his mouth, whereupon he was immediately seen to be suffering from an upper bicuspid abscess

The sudden enormous swelling of the eyelids that is so well known in ordinary 'black eye" from a blow with a fist finds an inflammatory counterpart in the dramatic

Styes

Encouraging results have been obtained during recent years from the treatment of styes by autogenous vaccines The usual causative organism is the *Staphylococcus aureus*, and it can be as obstinately persistent and troublesome in this situation as in other parts of the body Lowered resistance to this organism is often quite compatible with extremely good general health In many cases of recurrent styes the refraction is normal, the general health good, and the rest of the body is free from staphylococcal outbreaks It is not to be wondered at that an enormous number of different remedies have been administered by all the usual channels in an attempt to cure repeated styes of doubtful origin

Damage to the Cornea

By reason of its ectodermal origin the cornea shares the susceptibility of the skin to certain infections and dystrophies Thus in myxoedema degenerative changes sometimes occur in the cornea comparable to the skin disorder which is characteristic of that disease Severe corneal ulceration is by no means uncommon as a complication of small-pox Measles is another notorious cause of corneal ulcers One of the most dangerous of all skin diseases for the eye is pemphigus, which may lead to desiccation and progressive contraction of the conjunctiva, symblepharon, and widespread corneal opacity Dermatitis herpetiformis may act in the same way

A few years ago I saw a boy aged 14, suffering from shrinkage of the right conjunctiva at the lower fornix The cornea of this eye was unaffected The left eye showed marginal blepharitis together with xerosis and shrinkage of the conjunctiva, and multiple corneal opacities In this case there was a history of an attack of water blisters all over the body nine years previously, since which time there had been several other attacks, usually lasting about three months For the two years immediately preceding my examination he had had no bad attack of blistering During some of the later attacks both eyes, especially the left one, had discharged There had also been some small ulcers on the palate and inside of the cheeks, but these had left no scars Dr Freshwater, who kindly examined this patient for me was of the opinion that the skin attacks in the past were more likely to have been dermatitis herpetiformis than pemphigus

Rosacea

Rosacea is one of the most important examples of a skin disease capable of involving the cornea The great majority of sufferers are exempt from corneal complications Most of them get no worse eye trouble than a mild scaly blepharitis, together with perhaps an occasional meibomian cyst Conjunctivitis arising in the course of rosacea is often of sinister import The characteristic rosacea conjunctivitis is associated with much photophobia and lachrymation, and does not usually remain as a mere conjunctivitis After a while the enlarged vessels of the ocular conjunctiva show a tendency to invade the periphery of the cornea as forerunners of keratitis

Rosacea keratitis is always accompanied by excessive vascularization of the cornea, repeated exacerbations at irregular intervals, multiple ulcers, and the gradual formation of corneal opacities which are often disposed in a wedge shaped or tongue-shaped fashion principally in the lower half of the cornea In the early stages it is not uncommon to find grey or white nodules at the ocular conjunctiva near the limbus This phenomenon constitutes one of the many ways in which the clinical behaviour of kerato-conjunctivitis due to rosacea resembles phlyctenular disease In many cases of rosacea keratitis, especially if they can be examined at leisure during a quiescent stage, it can be observed that some of the scars are faceted as a result of the thinning which often occurs This destruction of the corneal substance may be so rapid and severe as to produce spontaneous perforation of the cornea in a certain proportion of cases

I believe that ophthalmic surgeons are increasingly on their guard not to overlook these cases of rosacea Patients with a severe facial efflorescence can hardly be missed by anyone who has ever had the opportunity of being shown a case of this disease Not uncommonly, however, the eyes may be badly affected at a time when there are few obvious signs on the face In my opinion any obvious or even suspected case of rosacea which may happen, in the first place, to come under the notice of an ophthalmic surgeon should be referred to a dermatologist in order that the actual disease may be systematically attacked In a large proportion of cases each relapse of keratitis will be found to coincide with a fresh outbreak of the facial trouble Bearing in mind the fact that spontaneous improvement and long remission from symptoms, even in the absence of treatment, are frequently noted in the course of this disease, it would appear that the actual results of local eye treatment are disappointing Some cases are said to benefit greatly from the local application of x rays, under expert control, to the cornea Local ultra violet light is of doubtful value Carbolization of ulcers is to be avoided if possible, because of the danger of exaggerating the tendency to form large adventitious corneal vessels Atropine, normal saline solution, and the use of dark glasses should be advised until ulceration has subsided

DERMATOLOGICAL ASPECT OF AFFECTIONS OF THE EYE*

BY

G B DOWLING, M D, F R C P

Physician Skin Department, St Thomas's Hospital

Rosacea is the condition with which the ophthalmologist and the dermatologist are most often concerned together Darier describes rosacea as a persistent passive erythema of the face, which leads to the production of telangiectases and is sometimes complicated by pustules In one group of cases, he says, rosacea is preceded by a first stage of recurrent attacks of acute congestion of the face In the second group it is derived from an affection of the epidermis which he has named "kérose" This we usually call the seborrhoeic state Thus rosacea is primarily a vascular disturbance affecting the cheeks, nose, forehead, chin, and sometimes the neck and the temples This disturbance has been most commonly attributed to digestive troubles, but I have welcomed the story of flatulence, fullness after meals, flushing after meals, alcohol, tea, etc, and any other symptoms of gastric disturbance, with some relief when such a history has been forthcoming On the contrary, in at least one half of my cases no amount of cross questioning has been successful in extracting the admission of gastric or intestinal symptoms of any kind I have, however, been

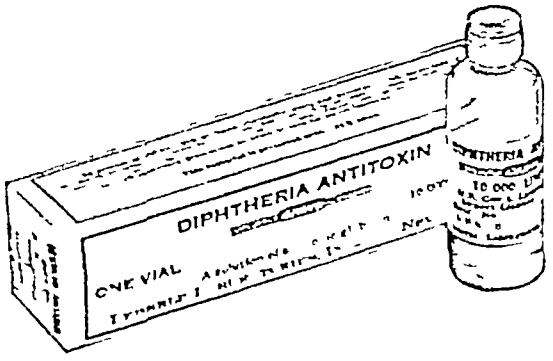
* Read in opening a discussion in the Section of Ophthalmology at the Annual Meeting of the British Medical Association Belfast, 1937

Diphtheria

GLOBULIN *Lederle* MODIFIED

ANTITOXIN

THE GLOBULIN-MODIFIED *Lederle* technique, embodying the principle of peptic digestion, is the only practical procedure which permits such a high degree of concentration of antitoxin and reduction in the amount of troublesome proteins—the cause of serum reactions



That is why Globulin Modified Antitoxins *Lederle* represent

- *a reduction in the expected incidence and severity of serum disease,*
- *less inconvenience to the patient*
- *a greater ease of administration,*
- *a greater potency per c.c*

DIPHTHERIA ANTITOXIN *Lederle* as prepared by the Globulin Modified Technique contains 6 000 to 7,000 units per c.c, except in the lower unitages where the volume is adjusted to facilitate ease of handling A concentration which we believe has never been previously attained with commercially available antitoxins

Since Diphtheria Antitoxin absorbs circulating toxins and checks the further spread of the toxemia, prognosis is largely dictated by the promptness by which adequate dosage is injected and the route by which it is given

The improved and refined *Lederle* product permits of the administration of large dosage in small bulk by the intravenous route without the fear of untoward reactions

Agents for the Irish Free State WILCOX JOZEAU & CO 19 Temple Bar Dublin

up, but it is infinitely less disagreeable than the second variety, which is in fact sycosis of the eyelashes

Mr Doggart has drawn your attention to the fact that this type of blepharitis often begins in childhood after an attack of measles Almost as often it follows what Sabouraud called confluent impetigo, a condition which is seen most often in children, we often call it impetiginous or infective dermatitis It may result from a neglected pus infection, particularly one caused by pediculosis capitis, or it may extend into the scalp from fissured impetigo of the post-auricular folds It is a very intractable condition, but while the scalp infection often clears up eventually, that of the eyelids generally persists for years, sometimes into adult life, when it may be followed in males by sycosis barbae In adults sycosis of the eyelashes also complicates chronic staphylococcal infection of the nasal vestibule and is generally accompanied by sycosis of the upper lip I see very little chronic impetiginous dermatitis of the scalp in children now as compared with ten years ago, and attribute the improvement to the care bestowed on children by school medical services In fact, to the best of my recollection I have not seen a new case for several years For the same reason pediculosis capitis is rarely met with among the children attending my hospital out-patient clinic

Dermatitis of the Eyelids

I would divide these cases into (1) Infective, in which the dermatitis is associated with blepharitis or conjunctivitis, or other infective condition (2) Dermatitis due to irritation by chemical substances (3) Seborrhoeic dermatitis involving the eyelids (4) Cases which it seems impossible to attribute to any of the above causes Unfortunately the last group appears to be more common than the others

The condition begins generally as an acute oedematous swelling of the eyelids accompanied by burning and irritation, and is followed eventually by desquamation Thereafter there are recurrent attacks and often a chronic persistent dermatitis I admit that it may be very difficult to exclude chemical irritation, but volatile irritants such as the emanations of plants generally attack the face and other exposed parts as well as the eyelids Cosmetic preparations, perfumes, hair dyes, etc, are easily excluded I have looked for evidence of infection in the canthi but generally without success, and I have wondered whether a low-grade infection may be present there without some objective evidence of it, such as fissuring Some of these patients may perhaps be sensitive to unavoidable stimuli, such as cold winds and sunlight I have certainly met with dermatitis of the eyelids in fair-skinned subjects who have to some degree experienced intolerance to climatic stimuli throughout life Some of my patients have been debilitated and neuropathic, and there is no doubt that the condition often persists more or less indefinitely as the result of rubbing to allay irritation The local treatment is difficult The inflamed eyelids seem to be intolerant to lotions containing powders, to fatty preparations, and to mildly astringent lotions In fact, I have found cold water compresses more useful in the acute stage than any other application To avoid gumming of the eyelids in the morning I prefer liquid paraffin to ointments

Miscellaneous Dermatoses

Lupus vulgaris lupus erythematosus and basal-celled epithelioma attack the eyelids with some frequency The treatment of these purely dermatological conditions hardly comes within the scope of the present discussion. So far as dermatologists are concerned I think I am probably right in saying that one of the principal objects in treatment is to avoid doing anything locally that may lead to ectropion

Pemphigus vulgaris may attack the conjunctiva together with the mucous membranes and skin, though fortunately this happens rather rarely In cases of the chronic type, which may last for years, pemphigus leads to the severe destructive changes mentioned by Mr Doggart In the more acute cases death has generally followed too soon for these changes to take place I have never seen the conjunctiva affected in dermatitis herpetiformis, though this condition is not rare and is extremely chronic

Some years ago Mr Gibb showed me at the West London Hospital a boy with the eye changes of pemphigus who had a history of blisters on the skin I have seen the same condition in a baby a year old There appears to be some doubt about the classification of these juvenile cases, and it may be impossible to settle whether they belong to pemphigus or to dermatitis herpetiformis until we know more about these two diseases I think it is quite possible that there is a juvenile pemphigus and a juvenile dermatitis herpetiformis, those in which the conjunctiva is affected being probably pemphigus Regarding zoster involving the ophthalmic division of the fifth nerve—another disease that interests us jointly—I would like to hear how often we are to expect permanent damage to the eye I would also remind you that the term zoster has been adopted by English dermatologists rather than herpes The latter is applied only to febrile, catarrhal, or recurrent herpes, a condition which is unrelated, clinically and aetiologically, to zoster I cannot speak of blepharochalasia, because to the best of my knowledge I have never seen it The remaining conditions which interest us jointly are of small importance, and they concern dermatology rather than ophthalmology

Warts and senile warts, which quite often affect the margins of the eyelids, can be treated satisfactorily with the point cautery under local anaesthesia Milium bodies can be extracted with a Hagedorn or similar needle Kromayer advises touching the capsule with the point cautery to prevent recurrences

Xanthelasma is best treated by a small operation Kromayer describes one in which the tumour is shelled out (under local anaesthesia) with very little disturbance of the healthy connective tissue, the incised skin being allowed to fall back into place with suturing I have seen a very good cosmetic result follow this operation by an ophthalmological colleague Some dermatologists treat xanthelasma by the application of trichloracetic acid I have been told that the results are satisfactory, though I have no experience of this method of destroying them

Hidradenoma of the eyelids is a condition that is probably best left alone

---

The first number has been published of a new monthly periodical *Medicine Today and Tomorrow* under the editorship of Dr D Stark Murray The publishers are C A Watts and Co, Ltd, 5, Johnson's Court, Fleet Street, E C 4, and the price is 4d The general aims of the journal, which is the official organ of the Socialist Medical Association, are to record the progress of "planned medicine" throughout the world and to advocate the establishment of a State Medical Service in this country

A Light, Nutritious Diet

As an easily prepared, easily assimilated, nourishing food, 'Allenburys" Diet has marked advantages over milk and the usual milk dishes in sickness, convalescence, old age, and other conditions

Prepared from pure, fresh, full cream milk and whole wheat, both partly digested during manufacture, it contains the chief food constituents in well-balanced proportions and is much more digestible than milk itself

Added vitamin D (calciferol), in the form of irradiated ergosterol, is present and, by promoting the formation of sound bones and teeth, makes the Diet specially suitable for children who have passed the stage of infant feeding

In tins at 2/1, 4/- and 7/6

Clinical trial sample will be sent post free on application

Allen & Hanburys Ltd.,

Telephone [illegible] Telegrams "Grimsbury Bath London"

20 c cm. of anti meningococcal serum was given On May 11 he was more drowsy and the neck rigidity more marked, Kernig s sign + The cerebrospinal fluid was similar to that of the day before Intrathecal anti meningococcal serum (20 c cm) was repeated On the 12th he was less drowsy, the cerebrospinal fluid was under normal pressure and was clearer A white cell count showed a total of 13,000, with 85 per cent. of polymorphs *H influenzae* was grown from the first specimen of cerebrospinal fluid On the 13th the cerebrospinal fluid was almost clear On May 18 a serum rash developed, but the patient was now sitting up and talking The neck rigidity had disappeared A blood culture, after six days incubation, was sterile The serum rash soon cleared and he made an uneventful recovery On discharge there were no physical signs and the cerebrospinal fluid was clear (This child was given sulphonamide P, half a tablet twice daily, from the second day)

Actiology

Meningitis due to the *H influenzae* is not such a rare condition as might be supposed Thus Neal (1934) and Huntington and Wilkes-Weiss (1936) found that it ranked fourth as a cause of purulent meningitis At St Thomas s (from 1922 to 1937), in children up to 8 years of age, a similar incidence was found meningococcal meningitis, thirty-seven, pneumococcal meningitis, fourteen, streptococcal meningitis, seven, *H influenzae* meningitis, six The age incidence is important, the majority of the patients being under 2 years, and the year with the highest incidence is 0–1 In the above series only one patient was over 2 years old

Most cases are thought to be "primary"—that is, not to be a complication of ordinary influenza A point in favour of this is the fact that in years when influenza has assumed epidemic proportions there has not been an increase in the number of cases of *H influenzae* meningitis Actually in 1918 only one case of this type was reported In many cases, however, there appears to be a definite association with otitis or pneumonia In Case 4 the chest condition was the prominent feature, and in ten out of forty-two infantile cases quoted by Huntington and Wilkes-Weiss (1936) the association seemed more than coincidence

Clinical Course

The onset may be sudden or gradual, more often the former In the cases reported above four may be said to have started suddenly The condition may be acute or subacute, but no case of chronic meningitis due to *H influenzae* has been recorded The course varies from a minimum of twenty-four hours, in the case of an infant cited by Huntington and Wilkes-Weiss (1936), to two or three months In a case recorded by Wood (1932), in which recovery took place, two months elapsed before the cerebrospinal fluid became sterile The usual duration is about two to four weeks

Clinically the condition does not differ from meningococcal meningitis, but most cases occur in infancy, and the signs are frequently suggestive of extrameningeal infection Pyrexia, which is often remittent and combined with a rapid and irregular pulse (Case 5), diarrhoea and vomiting, drowsiness or irritability, may be the presenting signs Usually the anterior fontanelle is found to be tense The most constant signs appear to be irritability and neck rigidity Local signs are uncommon, oculomotor paresis being most often present

Gibbens (1931) describes two clinical types (1) meningitis, (2) meningitis complicated by arthritis, which appears to be much rarer Moreover, he states that the arthritis may occur alone when no bone change takes place, whereas when the two are combined erosion of bone may be a feature

Pathological Investigations

Blood—In practically all cases a polymorph leucocytosis takes place Huntington and Wilkes-Weiss (1936) cite six cases out of the forty-five in which a leucopenia was noted, but only one count was recorded, and that was at the start of the illness, so probably a higher count would have followed

Blood Culture—A positive result is not infrequently obtained In a combined series of forty-three attempts, nineteen were positive In Case 1 the organism was grown, and failure resulted from the one attempt in Case 6 If the procedure was repeated in every case there would probably be a high incidence of positive results

Cerebrospinal Fluid—The fluid is usually under a raised pressure, and varies from faint haziness to frank pus Although the cells are almost invariably polymorphs, on rare occasions there may be large numbers of lymphocytes (Case 5, in which the fluid was quite abnormal) The total protein is raised and the chlorides lowered, though not to the extent seen in tuberculous meningitis Microscopically, the causative organism may be seen in a direct smear, but not infrequently, as in Cases 5 and 6, no bacteria are to be found until the cerebrospinal fluid has been cultured For culture a medium containing blood is necessary, and several days may elapse before a growth appears It is possible that some of the cases of "meningitis cause unknown" may be due to the apparent absence of *H influenzae* in the direct smear The *H influenzae* is said to produce indole, but as *B coli* admittedly a rare cause of meningitis, does this, indole production cannot be considered to be pathognomonic

Post-mortem Findings

There is engorgement of the superficial vessels of the brain, and vascular thrombi are common A thick purulent exudate collects round the base of the brain and to a lesser extent over the sides and vertex, and may even extend down the spinal cord Degeneration of the superficial layers of the cerebrum is usual, and in many cases areas of necrosis and even small abscesses, as in Case 5, may be present. The ventricles are distended, and should the basal exudate organize a considerable degree of internal hydrocephalus may result The other organs usually show nothing of note, except that fatty degeneration of liver and kidneys is almost invariable The association with otitis and pneumonia has been mentioned

Complications

Besides remissions and relapses, both of which may occur, the following have been described broncho pneumonia, sinusitis, otitis media, suprarenal haemorrhage, arthritis (Gibbens, 1931), superficial cutaneous abscesses, cellulitis, pleural effusion, pericarditis and endocarditis, and peritonitis (Williams, 1934) All these complications appear to be rare

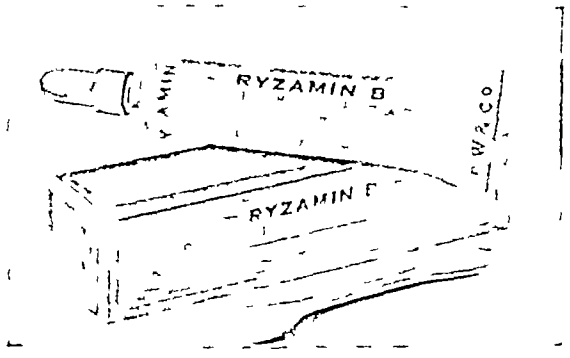
Prognosis

This is bad, but is better in the comparatively infrequent cases occurring in older children and adults Bloom (1931) collected 302 cases from the literature up to 1930, and found a total mortality of 92 05 per cent. In Rivers s (1922) series of 220 cases 92 per cent proved fatal Of

TRADE MARK 'RYZAMIN-B' BRAND

RICE POLISHINGS CONCENTRATE

Vitamin B_1 in high concentration



Stimulates the appetite and assists digestion

Promotes growth and increases alertness in children who lack weight and vigour

Particularly valuable in conditions where there is loss of weight and anorexia after prolonged fevers and chronic wasting diseases

Beneficial in those cases where wholemeal bread is precluded from the diet

Collapsible tubes—15 grammes ($\frac{1}{2}$ oz approx.) 1/10 each 100 grammes ($3\frac{1}{2}$ oz approx.) 10/ each

PREVENTIVE MEDICINE

The Practitioner's Library of Medicine and Surgery Vol XII *Preventive Medicine and Hygiene* (Pp 993 illus. Sold only in sets £2 10s per volume) New York and London D Appleton Century Company 1937

Up to and including the earlier years of this century preventive action against disease had been for the most part environmental, of the nature of a massed attack, usually by or at the instance of a public authority of some kind A very substantial measure of success attended these endeavours, and though the work was not complete the ground was sufficiently cleared to permit of preventive effort being brought more closely to bear upon the individual by means of measures adjusted to his personal need at the hands of private persons The art of medicine broadened out, it invaded the preventive field in force, and the outlook of the practising doctor, ceasing to be exclusively remedial, came to include the aspiration to prevent the diseases which he had once been content to cure after they had begun That the best opinion has moved in this direction in the United States as well as in our country is exhibited by the circumstance that the twelfth and concluding volume of a well known American practitioner's library of medicine and surgery is entitled *Preventive Medicine and Hygiene* Twenty-six authors have contributed to the text of the volume, which consists of four principal divisions—the first on individual hygiene, the second on group hygiene, the third on communal health, and the last on specific diseases

Among the topics dealt with in the first division are the periodical health examination, the hygiene of nutrition, including energy requirements, the hygiene of exercise, with sound views on endurance contests in adolescence, the hygiene of air, sunlight, and cleanliness, sex hygiene, which is greatly overdone, and mental hygiene The second division is concerned with group hygiene It is good on the lighting and ventilation of the home, touches on the prevention of foot mycosis in bathrooms, and gives special attention to what is a difficult problem in America, the water supply and sanitary equipment of solitary rural houses It discusses health in schools and universities and also in industry It deals in a most interesting way with the health hazards of farming, including the risks from farm machinery In this connexion the pronouncement is made, "Workers must avoid being caught in the belt"—a conclusion at which they might possibly have arrived unaided—whereas in the note on lightning no guidance is given on the very pressing question where it is best for the farmer to go if caught out of doors by a thunder storm There is a useful article, too, on safeguarding health when travelling or camping

The third division contains a lucid and well balanced chapter upon the effects of environment on health and disease, in which the problem of air changes in rooms as the result of human occupancy is duly presented Reference is made to the 'effective temperature" as worked out at Pittsburg, by which a single index can be used to express the combined effect upon the body of temperature, humidity, and air movement. The author of the chapter accounts it a defect of the Pittsburg index that it ignores the comforting influence of radiation, a criticism in which hygienists in this country, where radiation counts for so much in the heating of rooms will readily concur Other good chapters in this division deal with water supply, milk, and tuberculosis control While the chapter on maternity and child hygiene sets forth the preventive action required, it quite fails to exhibit how very closely the measures to be adopted are related to the principal causes of pre-natal, neo natal, and maternal death The final division on the specific diseases extends over a wide field, including the infections, the intoxications, physical agents, the deficiency diseases, allergy, and the endocrine diseases, together with cardiac, locomotor, nervous, and other diseases of the special systems We have found nothing in this large section which does not win our approval

We feel sure that every practitioner who already possesses volumes I to XI of the series will regard this concluding volume as maintaining the high standard of utility set by its valued predecessors

PRICE'S TEXTBOOK OF MEDICINE

A Textbook of the Practice of Medicine By various authors, edited by Frederick W Price, M D, C M, F R C P Fifth edition (Pp 2 078 illustrated. India paper 45s net ordinary paper 36s net) London Humphrey Milford, Oxford University Press 1937

The fifth edition of *A Textbook of the Practice of Medicine* edited by Dr F W Price, will enhance the high reputation already won for this exposition of what is essentially the teaching of the London School of Medicine Certain contributors to the previous edition have died, and six new authorities have been taken into the team Of these Dr F M R Walshe had perhaps the most difficult task of revising the original and highly esteemed contributions by the late James Collier and W J Adie, *and he may be said to have succeeded admirably The list* of articles entirely or in part rewritten is a long one, and there are also many new articles and sections dealing with advances in diagnosis and treatment There are also nine new illustrations The ordinary edition, of over 2,000 pages, with over 150 pages of index (always an excellent feature of this production), is now unfortunately a somewhat heavy volume, and the publishers are to be congratulated upon their decision to issue an edition on *India* paper, which is well worth the extra price Dr Price is performing a very valuable service in his editorial duties in connexion with this standard work, and in its revised form it will undoubtedly continue to make a wide appeal to teachers, consultants, general practitioners, and students in the English speaking world

PULMONARY EMBOLISM

L Embolie Pulmonaire (Recherches Cliniques, Anatomiques Pathogéniques, et Thérapeutiques sur les Embolies et les Infarctus du Poumon) By Pierre Bardin (Pp 192 11 figures, 2 coloured plates 35 fr) Paris Masson et Cie 1937

Pulmonary embolism, because of its tragic association with childbirth and with surgical operations, occupies almost a unique position among medical problems, and it must be admitted that it is as yet an unsolved problem Dr Bardin, to whose experimental work attention has already been drawn in this *Journal* (1935, **1**, 1180, 1937, **1**, 622), describes in his book the clinical and pathological aspects of the condition, and exposes succinctly and logically the inadequacies of the views held regarding its aetiology He points out that the reported increase in incidence may be more apparent than real, particularly as the diagnosis is often not confirmed at necropsy Even in the type of embolism associated with heart disease the accepted mechanism—blood stasis followed by separation of clot—will not explain why pulmonary infarcts occur in

BRITISH MEDICAL JOURNAL

LONDON SATURDAY OCTOBER 23 1937

OBSERVATION AND EXPERIMENT AND THE PHYSIOLOGY OF THE STOMACH*

BY

SIR ARTHUR HURST, D M , F R C P.

Senior Physician to Guy s Hospital

The task of the two hundred and eighty first Harveian Orator is not an easy one It would indeed be almost impossible if he were still expected to follow to the letter the instructions laid down by Harvey when he conveyed his patrimonial estate of Burmarsh to the College for the endowment, among other objects of an annual oration It was natural that Harvey should desire that the oration should be delivered in Latin, for during the four years he spent as a medical student in Padua he acquired such a perfect colloquial knowledge of the language that he thought with equal facility in Latin and English, and the manuscript notes for his Lumleian lectures are written in a quaint mixture of the two languages But happily in course of time more and more freedom of action has been permitted to the Orator In the oration of 1863 Dr Alexander Sutherland asked whether it would not be more convenient for the audience and easier for the Orator to substitute English for Latin The following year Dr Robert Lee delivered the last oration in Latin , in 1865 Sir Henry Acland delivered the first in English Since that date Harvey s injunction that the oration should be in Latin has no longer been obeyed—a mercy to those Orators who, like myself, have forgotten most of the little Latin they ever knew, and perhaps a still greater mercy to the majority of their audiences In 1846 Dr John Elliotson rightly believing that he had something of real importance to say on the subject of mesmerism thought it necessary to take the unprecedented precaution of having a translation of his oration printed after the Latin original So great was the general opposition to mesmerism at the time that the editor of the *Lancet* suggested that the portrait of Harvey should be turned with its face to the wall during the delivery of the oration

I wonder how many Fellows of the College to day would be capable of composing a Latin oration which would have satisfied Sir Henry Halford who was President when the College moved from its third home in Warwick Lane near St Paul s Churchyard to its present quarters in 1825 and who was as famous for the ease and elegance with which he spoke Latin as for his skill as a physician He was accustomed to compose Latin verse to beguile the tedium of driving in his carriage from one noble patient to another and was so impressed with the importance of the classical culture and staid philosophic habit of mind engendered by education at the older universities that he strongly opposed the abolition of the rule that the Fellowship should be confined to graduates of Oxford and Cambridge It was not until 1835 that, in spite of his continued opposition, the reform was introduced

Benefactors

Harvey desired the Orator to commemorate all the Benefactors of the College by name and what in particular they have done for the benefit of the said College with an exhortation to others to imitate those Benefactors He would rejoice that to-day our benefactors have become so numerous that this is no longer possible, for such a recitation, if brought up to date, would occupy the greater part of my time I will therefore do no more than refer to certain recent benefactions of a novel character which have an important bearing on the present and future activities of the College Benefactors in the past have endowed lectureships to give Fellows an opportunity to describe the results of their original investigations and observations and others have founded prizes to mark the accomplishment of good work done in various branches of medicine But until recently the College had no means of encouraging young men of promise to follow Harvey s further instruction to seek every means of advancing the science of medicine by research They were too often compelled to occupy much of their time with routine duties which required no intellectual gifts and offered no sort of mental training in order to earn a living This deficiency has now been partly overcome by the munificence of the Leverhulme Trustees James Maxwell Grant Prophit Eliza Streatfeild and Sir George Mackenzie It is gratifying to be able to record that the holders of the research scholarships founded by these benefactors have already done much admirable work Four of them—Dr J F Brock, Dr S J Hartfall Dr R L Noble and Dr C C Ungley—have made important contributions to our knowledge of the subject which I propose to discuss to-day in connexion with the modern application of the Harveian method of research

Research

Harvey invited the Orator to exhort the Fellows and Members of the College to search and study out the secrets of Nature by way of experiment But he was equally alive to the importance of accurate observation In *De Generatione* he notes how

"many remarkable discoveries have been achieved by men who following the traces of Nature with their own eyes

* The Annual Harveian Oration delivered before the Royal College of Physicians of London on St Luke s Day 1937

anatomical basis The post-mortem appearances of kidneys, especially when studied in sections of small pieces under the microscope, are so diverse that no clear correlation with the clinical phenomena observed during life is possible Nor is it easy to make a classification according to aetiology The author favours a classification which may be described as biological or functional, which is concerned less with the localization of lesions in the kidney than with the intensity of the state of change of function Thus there may be simple nephropathies—albuminuric, haematuric, or hypertensive, with lesions of kidney but no essential change in function—and complicated nephropathies (nephritis) where there is alteration of renal function, especially in the metabolism of water and excretion of sodium chloride

In the present series of articles Professor Rathery does not pursue the purely renal side of the subject, which he had developed at length in the first series, but has brought together an interesting group of clinical cases illustrating the outskirts of the subject He discusses the relation of purpura to nephritis, renal lesions associated with vegetative endocarditis, nephritis in poisoning with lead or mercury, and the forms of involvement of liver and kidney so insisted upon by French authors which occur, for instance, in infective or toxic abortion. Five of the twenty lectures are devoted to the problems of the existence, characteristics, clinical course, and treatment of cases more or less conforming to the conception of nephrosis in the original sense of Epstein's description The gouty kidney, the lesions of the kidney occurring with lithiasis and renal dwarfism, are also dealt with As in the former series, the author s method makes the subject alive and interesting

Notes on Books

Travaux Pratiques de Bactériologie (Masson, 38 francs), by H Bonnet and A Névot is a small handbook of 178 pages intended for the guidance of the medical student in his practical studies of bacteriology The field is well covered, and the information in the main is both adequate and correct The first five chapters are concerned with the characters of bacteria in general and the methods available for their study, the rest of the book is devoted to a consideration of the different bacteria pathogenic for man Here and there one comes across omissions and erroneous statements For instance, one reads on page 8 that anaerobes differ from aerobes in that the former are killed by oxygen, and in the typing of pneumococci agglutination alone is relied on, no mention being made of the "quellung" reaction of Neufeld In the chapter on the diphtheria bacillus, too, there is no mention of types or the use of tellurite media However, points such as these are few and far between, and to dwell on them would be to give a false picture of the book One of its outstanding features is its illustrations Line drawings, photomicrographs, and colour photographs are freely called on to illustrate the text, the photomicrographs in particular are excellent, though it is a pity that in faking the dark-field picture of *L icterohaemorrhagiae* the spirals should have been continued right to the ends of the spirochaete The book is well printed and is of a size convenient for the pocket

In his preface to the thirty-fifth edition of the late Professor Halliburton's *Handbook of Physiology and Biochemistry* (John Murray, 18s) Professor R J S McDowall recalls that the keynote of this ever-green book is to supply the needs of a medical student preparing for his examination, and this aim limits both material and length The publishers have entered very wholeheartedly into the preparation of the volume and have here taken the long view that considerable changes are frequently necessary if the book is to retain popular favour" It will be observed that the title now includes "Biochemistry" This addition has long been overdue in a volume which during Halliburton s authorship was a pioneer in such instruction, though he always preferred the term "Chemical Physiology" Professor McDowall has been associated with the book for the past nine years, and his name is now added to Halliburton's as joint author

Die Organisation der Tuberkulosebekampfung im Lande Baden by Dr Walter Schmidt (Leipzig, Georg Thieme, RM 3 60), gives a fairly detailed description of the development and administration of the tuberculosis campaign in the district of Baden, with particular reference to the new public health laws in Germany The organization in this district is of special interest, for the favourable climatic conditions of the district have led to the establishing in the past of numerous institutions for the treatment of tuberculosis, which the State found available for taking over The result is that tuberculosis is there regarded "literally' as an infectious disease, and every patient found to be suffering from the disease or suspected to be suffering from it can be hospitalized immediately The cost of treatment is borne either by insurance societies or by the State Isolation of sputum positive patients forms an important part of the scheme Two-thirds of the brochure consists of extracts of the legal documents governing the operation of the various measures and their financial aspect

Preparations and Appliances

SULPHONAMIDE-P

Sulphonamide P (Wellcome brand) is a preparation of *p* aminobenzenesulphonamide in powdered form It is suitable for both parenteral or oral administration The clinical uses of this drug are at present the subject of intensive research, the general result of which has been to show an unexpectedly wide range of bactericidal effects The makers (Burroughs Wellcome and Co) in their descriptive leaflet point out that not only is the value of the drug well established in a wide range of conditions due to infections with haemolytic streptococci, but also that both laboratory experiments and clinical experience justify its trial in cases of meningococcal meningitis, gonorrhoeal arthritis, *B coli* and *B proteus ammoniae* infections of the genito urinary tract Finally, laboratory experiments indicate that the drug may prove of value in typhoid and paratyphoid fevers and in staphylococcal septicaemia or infections The leaflet also gives a short account of the precautions indicated for the avoidance of unpleasant side-effects such as methaemoglobinaemia and sulphaemoglobinaemia

MANDECAL

Mandecal (compound calcium mandelate, B D.H) is the outcome of an investigation undertaken by British Drug Houses Ltd to find a preparation of mandelic acid which would produce minimum gastric disturbance Calcium mandelate was found to be as effective as ammonium mandelate as a urinary disinfectant, but to cause less gastric disturbance than the latter Mandecal is a pleasantly flavoured powder containing 75 per cent. of calcium mandelate It is taken in the form of a suspension in water The dose recommended is 15 to 20 grammes a day

PREPARATIONS OF GUAIACOL

Anastil and anastil forte are preparations of free guaiacol in watery solution in ampoules The drug is given by intramuscular or intravenous injection It is recommended for the treatment of a variety of bronchial infections (bronchitis bronchiectasis, etc) The vendors (Vial and Uhlmann 30 Gutleutstr, Frankfurt) quote a variety of favourable references which have appeared in German clinical journals.

daily observations and experiments, which laid the foundation of our knowledge of gastric digestion Harvey's observations were concerned with the mechanical action of the stomach in altering the physical properties of the food so as to render it fit for absorption Beaumont's work was concerned with the changes which occur in the stomach as a result of the digestive activity of the gastric juice He described the physical properties of gastric juice and had samples analysed which confirmed Prout's recent discovery that it contained free hydrochloric acid He showed that the juice is secreted only in response to the entry of food into the stomach and demonstrated its action on different kinds of food both within the body and *in vitro* He recorded how as a result of fear and anger febrile disturbances, and excessive indulgence in alcohol the gastric mucous membrane became red and swollen and the juice was replaced by a secretion of mucus

For twenty years after 1833 Beaumont made repeated attempts to persuade St Martin to return to him so that he could continue his investigations but without success In 1840 the British Association made a grant of £200 with the object of bringing St Martin to England so that further experiments on the physiology of digestion might be carried out on him by a committee consisting of Prout Owen Graham and Thomson, but he refused to leave his Canadian home where he died aged 83 in 1880

The next important step in the progress of knowledge concerning gastric digestion was the employment of the stomach tube which had long been used as a means of treating cases of poisoning This was done by Leube in 1871 though the first 'test meal had been given over a century before by Réaumur to his pet kite which had the habit—like other kites—of rejecting from its stomach anything which it could not digest In a paper on the digestion of birds read before the Académie des Sciences in 1752 he described how he fed his kite by giving food enclosed in small metal tubes the ends of which were covered by a wire grating The tubes were subsequently rejected and their contents examined Meat was partly dissolved and showed no sign of putrefaction Bone was also dissolved but vegetable material remained unaltered He then filled his tubes with pieces of sponge and obtained for the first time pure gastric juice, which he found turned blue paper red

In 1885 Ewald and Boas invented the test breakfast and in 1915 Rehfuss using Einhorn's duodenal tube introduced the fractional test meal In 1920 the normal standard of secretory activity was laid down by Izod Bennett and Ryle as a result of their examination of a hundred medical students Since then many physicians including numerous Fellows and members of the College have carried out physiological and clinical observations with the fractional test meal which have done much to elucidate the complicated problems concerned with the secretory activity of the stomach in health and disease

The Antiseptic Barrier of the Stomach

As long ago as 1784 Spallanzani of Pavia demonstrated the antiseptic action of gastric juice by showing that it prevented and even arrested the putrefaction of meat Thus meat moistened with gastric juice did not decompose and the putrid odour of decomposing meat was lost on introducing it into the stomach of an animal In recent years the subject has been reinvestigated by Knott a member of the College who has shown that the normal sterility of the stomach and upper part of the small intestine depends upon the secretion of hydrochloric acid in the gastric juice In achlorhydria the abnormally alkaline secretion of the contents of the small intestine affords a favourable medium for the growth of the *Bacillus coli* which invades not only the small intestine but also the stomach The infection of the duodenum is of special importance, as it often leads to an ascending infection of the bile ducts and is responsible for many cases of cholecystitis The loss of the acid antiseptic barrier of the stomach also permits infection of the small intestine by swallowed organisms in streptococcal infections of the teeth and tonsils and Camps has demonstrated the importance of the acid barrier as a protection against infection by typhoid, paratyphoid, dysentery and cholera germs Utilization of this knowledge should in the future do much to reduce the incidence of these infections amongst Europeans A fractional test meal should be an essential part of the examination of soldiers and civilians about to serve in the East, and the presence of achlorhydria which would be discovered in about 4 per cent of their number, should be regarded as an absolute bar against such service

Faber of Copenhagen showed in 1909 and again in 1913 that achlorhydria in women is often associated with simple anaemia This simple achlorhydric anaemia has been very thoroughly investigated during the last few years, especially by Witts and subsequently by other Fellows of the College When normal gastric juice is secreted the iron present in organic combination in the food is readily assimilated by the small intestine In the absence of free hydrochloric acid deficient absorption of iron occurs This leads to a simple microcytic anaemia if the quantity of iron in the food is no greater than the minimal amount required by people with normal gastric digestion especially if excess of blood is lost as a result of menorrhagia

Addison's Anaemia a Disease of the Stomach

In 1880 Samuel Fenwick, a Fellow of the College whose admirable work on the pathology of the stomach is apt to be forgotten to-day, noticed that the glandular structure of the gastric mucous membrane of patients dying from Addison's anaemia was atrophied and contained so little pepsin that no post mortem digestion could take place He suggested that the lack of normal gastric juice which resulted from this atrophy must interfere with the formation of blood and that Addison's anaemia might consequently be regarded as a direct result of atrophy of the gastric glands In the years which followed the constant association of Addison's anaemia with achlorhydria gradually became recognized but Fenwick's theory was forgotten The pioneer work of William Hunter on oral and intestinal sepsis led to the assumption that achlorhydria favoured the production of a haemolytic toxin in the intestines and that this was the cause of Addisonian anaemia Against this theory however was the absence of any change in the blood in the large majority of people with achlorhydria and gastric digestion was as completely in abeyance and bacterial growth in the stomach and duodenum was just as vigorous in uncomplicated achlorhydria as in achlorhydria with severe anaemia Moreover the administration of hydrochloric acid failed to produce any striking improvement in most cases of Addison's anaemia It seemed clear therefore, that although achlorhydria was constantly present in Addison's anaemia it was not directly responsible for its development

This was the state of our knowledge on the subject when in 1931 Castle a young Harvard physician who had been

in the lining of the stomach may have repercussions on the nutrition of the body as a whole, and may be associated with anaemia and with subacute combined degeneration of the spinal cord Since 10 per cent of all cancers occur in the stomach, and gastritis is in the forefront of predisposing causes of gastric cancer, a deeper significance attaches to its treatment Not only should there be a stimulus and a concerted effort to relieve sufferers of their dyspeptic symptoms, but also by timely interference to prevent the beginning of malignant changes Sir Arthur Hurst adduces evidence of a varied incidence of cancer of the stomach in different parts of the world, and has instituted an inquiry on comparative lines into the possible aetiological factors of gastritis in two large hospitals in England and Holland The results suggest a significant increase in unhygienic habits and the use of gastric irritants in Holland, where cancer of the stomach is found to be more than twice as frequent Such inquiries on international lines and with international co-operation are important The recent drive towards enhancing the health of the community, initiated by the Government, can be made more widely embracing In these modern times, with rapid transport and free circulation, the ready dispersal of disease and infection, the old dictum becomes even truer, that no man liveth unto himself as no man dieth unto himself The health of the world cannot remain an academic, a parochial, or even a national matter International associations for the exchange of ideas and the dissemination of knowledge can promote an international comity of medical men throughout the world in the spirit of Harvey, searching out the secrets of Nature, that the advances of knowledge may be used for the good of mankind

MEDICINE IN PARLIAMENT

In the Parliamentary Session which is just closing the Premiership of the United Kingdom has passed for the first time to a former Minister of Health, Mr Neville Chamberlain, and the attention devoted to national health by the House of Commons has only been surpassed by its concern over foreign affairs Sir Kingsley Wood, who might have claimed a transfer to another office, has chosen to remain Minister of Health, and Mr Elliot has passed from the Department of Agriculture to the Scottish Office, which includes the Scottish Department of Health During the session Sir Kingsley Wood secured the passage of the National Health Insurance (Juvenile Contributors and Young Persons) Act, which lowers the age of entry into national health insurance, of the Widows' Orphans' and Old Age Pensions (Voluntary Contributors) Act, of the Local Government Superannuation Act, and of the Public Health Drainage of Trade Premises Act To Mr Elliot's credit are the Children and Young Persons (Scotland) Act, the Local Government Superannuation (Scotland) Act, and the Maternity Services (Scotland) Act Other Ministers have carried measures affecting health, outstanding among which are the Factories Act, introduced by Sir John Simon and Mr Geoffrey Lloyd, the longest and most closely examined Bill of the session, and the Physical Training and Recreation Act, brought in by Mr Stanley The Agriculture Act, affecting public veterinary services and their relation to medical officers of health, and the amendments to the Milk Marketing Scheme brought the Department of Agriculture into the sphere of public health issues Of the measures which resulted from the initiative of private members the Matrimonial Causes Act stands out It was introduced under the title of the Marriage Bill, and in both Houses there was vigorous debate on the question of insanity as a ground for divorce A Bill to check the sale of methylated spirits to addicts in Scotland was brought in by a private member and carried Among private Bills concerned with hospitals the Liverpool United Hospital Act is noteworthy

Three things which the British Medical Association may fairly claim to have "put on the map" —namely, physical fitness, physical training, and *nutrition—were the chief topics in the debate* on the Address with which the session opened in the Commons, and a debate on the feeding of children took place soon after the Christmas recess In the House of Lords at the beginning of the session a debate on the health and physique of the nation was the occasion for a speech by Lord Horder on food and fitness Later in the session the tendency to make nutrition a Party issue was less marked than it had been in 1936, though the Opposition inclined to present it as the alternative to the Government's proposals for the development of physical training A debate on the trend of population and the low birth rate, in which Sir Francis Fremantle spoke, held the attention of the House Later the Government appointed a Royal Commission to report on the distribution of the industrial population An unexpectedly full and balanced debate arose on a motion advocating the voluntary sterilization of the mentally deficient Sir Kingsley Wood dealt with this by citing the investigations promoted by the Medical Research Council, and declared that although unanimity could not now be secured, even from the British Medical Association, opinion was growing in favour of such sterilization This motion was withdrawn, whereas a Bill introduced in the House of Lords

endeavour to follow in the footsteps of Harvey and take an active part in advancing the science of physiology

The thirty years which have witnessed such a revolution in our knowledge of the functions of the stomach have witnessed an equally great revolution in our knowledge of gastric disorders When I was house-physician in 1905 the *x* rays had not yet begun to throw light on gastro intestinal problems We occasionally gave a Boas Ewald test meal but the information it yielded was of infinitely less value than that obtained from the modern fractional method The significance of occult blood was unknown Consequently diagnosis depended upon the history and physical examination alone As the latter is completely negative in the large majority of gastric cases diagnosis depended almost entirely on the history But the correlation of history with pathological findings was possible only in fatal cases, as the pathology of the living —the greatest gift of surgery to medicine—was still in its infancy Consequently the diagnosis of the minor and chronic disorders was a matter of guesswork, as there were no means of discovering the pathological cause of symptoms in non fatal cases But a former Harveian Orator, Sir William Hale White, and the President of the College, Lord Dawson were at that time showing that combined clinical and pathological research in the tradition of Bright, Addison and Wilks could still bring important facts to light, when they demonstrated that gastric ulcer was really a disease of middle life affecting males more frequently than females and not as had hitherto been universally believed a disease of anaemic young women This discovery was soon to be confirmed by Moynihan whose genius has been curiously underestimated by his surgical colleagues, who, whilst acclaiming what he did for the art of surgery, forget what he did for the science of medicine His discovery of the clinical picture of duodenal ulcer was as much a piece of original scientific research as the discovery of a new element or a new star and as equally deserving of recognition It is perhaps difficult for the present generation to realize that in 1907 when Moynihan was already accurately diagnosing duodenal ulcer from the clinical history almost daily in Leeds it had never been diagnosed in London apart from an occasional lucky guess in cases of perforation and his papers on the subject were regarded as the products of a too vivid imagination British physicians awoke to the truth in 1909—nearly ten years before their Continental colleagues as late as 1913 Ewald stated his belief that only one duodenal ulcer occurred for every forty five gastric ulcers

The Pathogenesis of Carcinoma of the Stomach

It is now generally believed that carcinoma never develops in a healthy stomach There is abundant evidence to show that in the 70 per cent of cases with achlorhydria the carcinoma results from malignant degeneration of chronically inflamed mucosa the achlorhydria being a result of the preceding gastritis and not of the carcinoma In the remaining 30 per cent of cases with a normal or high acidity the evidence is equally conclusive that the carcinoma is a result of malignant degeneration of a simple ulcer The chronic gastritis and the simple ulcer are caused by chronic irritation the former especially in individuals born with a hyposthenic gastric constitution and the latter in those with a hypersthenic gastric constitution

The irritants which give rise to gastritis and gastric ulcer are mechanical chemical and thermal food insufficiently broken up and softened owing to its coarse character to hurried meals or to insufficient teeth or dentures irritates the mucous membrane mechanically alcohol and tobacco highly seasoned food, drugs, and saliva swallowed by patients with oral sepsis are chemical irritants, very hot and very cold food and drinks are thermal irritants

The total incidence of cancer is approximately the same in both sexes in the rich and the poor, and in all nations If cancer of the uterus and breast are excluded the relative incidence in different organs is the same in men and women It is also the same in the rich and the poor and in different nations with one supremely important exception—the stomach being involved three times as often in the poor as in the well to do, and in only 22 per cent of all cases of cancer in men in Great Britain compared with 42 per cent in America, 55 per cent in Holland, Bavaria, and Spain, and 66 per cent in Czechoslovakia

We have recently tried to discover the cause of the difference between the incidence in England and Holland —22 compared with 55 per cent The total incidence of cancer is the same in the two countries, and we have found as might be expected that the incidence of the hyposthenic and hypersthenic stomach is also the same We must therefore look for a difference in extrinsic causes Herbert and Bruske have compared the teeth and dietetic habits of 500 out-patients at Guy's Hospital with those of 500 at the Wilhelmina Gasthuis in Amsterdam 58 per cent of the Dutch ate too quickly and chewed insufficiently, compared with 11 per cent of the English, gross oral sepsis was present in 44 per cent of the Dutch and 28 per cent of the English Spiced foods were eaten in excess by 48 per cent Dutch and 19 per cent English, and official statistics show that the consumption of spirits is much higher in Holland than in England 43 per cent of the Dutch were accustomed to swallow their food and drink at a temperature over 60 compared with only 22 per cent English Lastly 62 per cent of the Dutch but only 13 per cent of the English smoked more than four ounces of tobacco, whether cigarettes pipes or cigars a week and 18 per cent of the Dutch but none of the English chewed tobacco

It is surely significant that wherever there is a difference between the dental condition and the dietetic and smoking habits in England and Holland it is to the advantage of England It seems reasonable to assume that the more frequent and more severe irritation of the gastric mucosa in the Dutch leads to a greater incidence of achlorhydric gastritis in individuals with the hyposthenic gastric constitution and of gastric ulcer in those with the hypersthenic gastric constitution If our views as to the origin of carcinoma of the stomach are correct this would explain why its incidence is so much greater in Holland than in England Insufficient teeth and dentures and oral sepsis coarser food and stronger tobacco may account for the greater incidence in the poor compared with the rich

At present we have no knowledge of how the general liability to cancer can be controlled and the organ inferiority which predisposes to achlorhydric gastritis on the one hand and to gastric ulcer on the other cannot be modified But the extrinsic causes—gastric irritants of all kinds—however trivial they may appear to be can be avoided and it should at least be possible to lower the incidence in the very poor by two-thirds to bring it down to the level of the incidence in the well-to-do

The future is full of hope By preventing the development of achlorhydric gastritis and gastric ulcer in the

normality in respect of mean values nor is there any as regards the limits of fluctuations round the average The report concludes that the simple measurement of height and weight is better in large-scale inquiries than the use of more complicated measurements But the recording of these data is only of real interest when it is periodically repeated under equal conditions Supplementary clinical examinations are dealt with of which the condition of the teeth and the presence of an unbroken and not unduly sinuous median furrow of the back when the child's arms are above the head are worth referring to as evidences of nutritional state The report recognizes the fundamental defect of all clinical assessments—that a given child may appear relatively satisfactory if he is examined among a group of average children whereas he would have been regarded as only fair if examined among a group whose condition was very good In other words, there is no criterion of normality That the average is by no means necessarily the normal in respect of nutritional state has been abundantly proved by feeding experiments In Corry Mann's milk supplement experiments, for example, the mean height increment among boys was 2 63 inches in a year compared with 1 84 inches in the group which received no milk The physiological tests for minor deficiencies such as the estimation of vitamin contents of blood and urine, the level of blood phosphatase in relation to rickets, visual adaptation to dark in relation to vitamin A deficiency, and capillary resistance in relation to vitamin C deficiency, are all fully discussed in the report. The use of these tests is critically examined, and although the value of every advance in objective measurement is apparent it is recognized that many of these tests are not yet established as specific, nor are the variations in the normal range properly fixed In another section the report discusses the type and scope of the inquiries at present conducted in various countries The tale of what is being done is an impressive reminder of the extent to which health departments have been awakened to the profound neglect of human nutrition which was prevalent until the last decade Progress will be slow until objective methods of assessing the nutritional state have been studied and defined and the Health Organization of the League of Nations has done a great service to science by calling together groups of experts to examine the achievements to date and to point out the most profitable lines for further research

ROAD ACCIDENTS AN INTERNATIONAL ANALYSIS

One of the tasks which the Council of the League of Nations has delegated to a committee is the unification of statistics of traffic accidents Every country is being asked to use a model form for recording all accidents causing death or bodily injury and to prepare therefrom annual statistics according to a recommended schedule Inquiry has shown that nearly all countries maintain records and analyses of such accidents the most elaborate being taken in the United Kingdom Denmark, Holland, and Switzerland The only European countries in which no statistics are kept are Lithuania and Iceland but even in Iceland all doctors are required to prepare reports for the General Directorate of Public Health at Reykjavik of any road fatality which comes under their notice The schedule which the League recommends is a very elaborate affair in five sections for setting out respectively the vehicles involved—that useful word has got into international currency—the nature of the accident, the sex and age of the persons killed or injured, the circumstances of the accident and its presumed or apparent cause The possible causes of accident for which drivers are responsible number twenty one The physical condition of the driver at fault is set out under the heads of insobriety, asleep, fatigue, illness, physical or mental defect, dazzled by lights, or confused by traffic Responsibility of pedestrians for a traffic accident may be set down under any of seventeen heads including insobriety and physical or mental infirmity Road and traffic conditions as causes of accidents apart from the personal factor are also to form the subject of analysis and the exact time should be stated—month day of week hour of day—whether full daylight or dusk and if after dark, whether there was good or poor lighting or no lighting Weather conditions are set out under seven heads and mechanical defects under six If the League gets its analysis carried out widely the victim of a road accident (if alive and conscious) will have the satisfaction of knowing that the cause of what has happened to him has been analysed as closely as is humanly possible and that the casualty has found its proper place in international archives

THE QUININE PROBLEM IN INDIA

We have received a copy of the *Star of India* containing a report of an address by Sir Henry Gidney to the Central Advisory Board of Health for India In this address Sir Henry criticizes the policy adopted by the Indian Government with regard to the quinine supply It is estimated that 100 million persons suffer from malaria in India, and that directly or indirectly the disease causes about two million deaths a year Adequate anti-mosquito measures are prohibitive in cost more particularly because the districts most heavily infected with malaria are also the poorest Anti malarial drugs are therefore, the only available defence against the disease and of these quinine is still the most important. The annual consumption of quinine in India is however, only 200 000 lb whereas the lowest minimum requirement is 600,000 lb Chopra (1933)[1] showed that in the most heavily infected districts of India the annual quinine consumption was less than 2 grains a head, whereas in Italy and Greece the average annual consumption was 16 and 24 grains a head respectively Chopra also showed that poverty was the limiting factor for quinine consumption, and hence the most heavily infected districts which were also the poorest, had the lowest quinine consumption

[1] Chopra, R. N (1933) *Indigenous Drugs of India*

add to our meagre knowledge of his life and character and of the friends among whom he worked He would I feel sure, have been particularly gratified by Dr Robert Hutchison's clear demonstration that he was endowed with the priceless gift of a sense of humour

He would have noted with surprise that the Presidential chair is occupied this afternoon for the seventh year in succession by the same Fellow, an event with only a single precedent since Sir Henry Halford ruled over the College for the twenty-four years between 1820 and 1844 He would realize that this could only be the result of the immense satisfaction of the Fellows for the manner in which its affairs have been conducted by Lord Dawson, during whose tenure of office the influence of the College on medical education, medical research and the public health has become more profound and more far-reaching than ever before

Harvey would be pleased to see how well his admonitions have been remembered, and to find that after three hundred years Fellows and members of the College are still taking a leading part in the research and study of the secrets of Nature by way of experiment And at the end of each Oration he would retire to the Elysian Fields, happy in the knowledge that ' to the honour of the profession ' the Fellows of the College ' continue to live in mutual love and affection amongst themselves "

ABSCESS OF LUNG*

BY

L. S T BURRELL, M D., F R C.P

Physician to the Royal Free Hospital and to the Brompton Hospital for Consumption and Diseases of the Chest

An abscess may be defined as a collection of pus in any part of the body In the lung it may be single or multiple and result from a variety of causes Strictly speaking, tuberculous or bronchiectatic cavities are abscesses Pyaemia resulting from osteomyelitis or operation often leads to multiple abscesses Maxwell (1934) found that in a series of 116 cases of multiple abscess sixty two followed septic conditions elsewhere Of 199 cases of single pulmonary abscess forty three resulted from pneumonia, thirty-two were associated with bronchial carcinoma, twenty-three with septic foci in some distant part of the body and only two followed tonsillectomy A considerable proportion of single lung abscesses which I have seen followed tonsillectomy or some other operation on the throat, nose or teeth, Scott Pinchin and Morlock (1930) found tonsillectomy responsible for 16 per cent of their cases There is also a number of cases for which no cause can be discovered In this paper cases of multiple abscess or those associated with tuberculosis carcinoma or other gross disease are not considered and I shall confine my remarks to the single abscess such as occurs for no apparent reason or as a result of pneumonia, ruptured empyema, embolism, or aspiration

Diagnosis

The first symptoms are a feeling of malaise and sometimes a nasty taste in the mouth The breath is often offensive even before there is any sputum Onset may be with haemoptysis but this is more common in cases associated with carcinoma The temperature is usually raised and if there is not free drainage through a bronchus it may be hectic in character Clubbing of the fingers appears early If there is sputum it may contain elastic fibres and pyogenic organisms, and is not usually offensive unless there is gangrene, which is said to be due to the Miller-Vincent spirochaetes present in the gums of many normal adults

On examination there may be no physical signs if the abscess is deeply situated If superficial there may be dullness or signs of associated pleurisy Radiography shows a shadow which may contain a fluid level It may, however, show merely an area of opacity which closely resembles a neoplasm or simple inflammatory lesion If neohydriol is injected into the trachea it does not as a rule enter the abscess cavity

It is best to locate the abscess by *x* ray films taken in different positions—antero posterior, oblique, and lateral Stereoscopic radiographs are apt to be misleading It has been said that an exploring needle should not be used to locate an abscess, since it may lead to infection of the pleural cavity and of the lung along the track of the needle I agree that it is unnecessary to aspirate a lung abscess, but think the danger of the procedure causing infection is much exaggerated, and I have never known it happen.

Prognosis

Abscess of lung must always be regarded as a very serious condition, whatever line of treatment is adopted Death may occur from extension into the lung tissue, toxaemia, haemoptysis or embolic spread to some distant part usually the brain Cerebral abscess appears to be rather more common in cases treated surgically

Treatment

Most authorities agree that medical treatment should be given a good trial in cases of single pulmonary abscess Postural drainage is often sufficient to enable the patient to cough up the abscess and make a good recovery An abscess in the upper zone is best drained with the patient sitting well propped up, and he should lie on his back for an abscess in the front part of the lung and on his face for one situated posteriorly In the case of an abscess in the lower zone he should lie on a bed with the pelvis raised and the chest and head sloping downwards For this purpose a bed such as that devised by Mr Nelson is of great value This can be raised in the middle so that the patient can drain for a long time and although the position looks uncomfortable it is remarkable how quickly a patient gets used to it By this means a number of cases can be cured and it is wise to allow a full six weeks before surgical treatment is attempted If patients are acutely ill with a large amount of sputum postural drainage is not advisable and it is usually best to operate

Treatment by artificial pneumothorax is now rarely employed, chiefly owing to the fear of the abscess rupturing into the pleural cavity and producing a pyothorax There is a very definite danger of this accident but in a number of cases the patient has eventually recovered after draining the pleural cavity It may happen that apart from pneumothorax the abscess breaks into the pleural cavity and very foul pus is found These cases often do quite well with drainage In the case of a deep abscess draining into a bronchus pneumothorax is still sometimes employed In my opinion the chief danger of pneumothorax (as is usually the case) that the pleura is adherent in the neighbourhood of the abscess and on cough a tear occurs at the junction where the lung is adherent to the chest wall and opens the abscess

Read in opening a discussion at a joint meeting of the Sections of Medicine and Surgery at the Annual Meeting of the British Medical Association Belfast, 1937

a voluntary hospitals regional council to correlate hospital work and needs in the region, (3) the formation of a Voluntary Hospitals Central Council to co ordinate the work of the regional councils Mr Stansfield P Richardson chairman of the Sunderland Royal Infirmary, will act as chairman of the new body, and Mr Arthur Morley, K C, Recorder of Sheffield, as vice-chairman

GARGOYLISM

The association of congenital osseous dystrophies with mental deficiency, dwarfism, deformity of the limbs, corneal opacities, and enlargement of the liver and spleen was first described by Gertrud Hurler in 1919 The growing number of reported cases has established the condition as a clear-cut syndrome In this country attention has been drawn to the subject by the recent work of Ellis, Sheldon, and Capon,[1] who reported seven cases in addition to ten from the literature In the absence of any pathological examination little could be said on the aetiology of the condition, though Tuthill's pathological report published in 1934 under a rather misleading title, suggested that it might fall into the xanthomatosis group of diseases An excellent article by Ashby Stewart, and Watkin[2] confirms this suggestion Reporting the pathological findings in two cases they show that both histologically and chemically the changes found in the central nervous system are strikingly similar to those observed in the Batten-Mayou disease One of their cases could be studied fully, in the second the material, collected thirteen years ago, was not sufficiently well preserved to allow of fine observations, although the changes seen in the first case were present here also, though to a milder degree As the patient in the first case was 20 years of age at the time of death and the second was 9 the authors find the discrepancies explicable They accept the work of Pick and Bielschowsky in regarding the changes in Batten-Mayou disease as being indicative of a general disturbance of lipoid metabolism and not, as is held by many observers, due to a local breakdown of the fats normally present in nervous tissue A fundamental difference of opinion is involved here, for there are some who regard only Tay-Sachs disease as a general lipoid disturbance to which the Batten-Mayou disease is aetiologically unrelated, while others hold that the two affections are allied conditions with the same underlying pathology Ashby Stewart, and Watkin go further than this They not only link up Tay-Sachs disease and the Batten-Mayou disease into one pathological unity, but they extend the range of the recognized lipoid disturbances, such as Gaucher's disease, Niemann-Pick's disease, and the Schuller-Christian disease to include the Hurler syndrome as well as Tay Sachs disease and Batten-Mayou disease This is an illuminating generalization but it is questionable whether it is altogether valid It brings forward once again the unsolved difficulty of the relation between the Tay-Sachs disease and the Batten-Mayou disease Those who support the theory of their pathological unity group the two syndromes under the name of amaurotic idiocy Clinically, however, each condition is so clear-cut and distinctive that those who approach the problem from this aspect see more significance in the histological differences than in the similarities Supporters of the unifying generalization, particularly Kufs, have extended amaurotic idiocy to include adult types of affection without amaurosis The inclusion by the present authors, Ashby, Stewart, and Watkin, of yet a further clinically distinct group illustrates that the range of affections which bear some resemblance pathologically to Tay-Sachs disease is indeed wide None the less, it remains doubtful whether it is justifiable to regard these different affections as being aetiologically allied Rather would it appear that the neuro-pathologist is exploring a special type of pathological degeneration, which is not necessarily pathognomonic of one underlying cause To attempt to link up these markedly different clinical pictures under one heading seems to be unwarranted in our present state of knowledge For one thing the fundamental issue as to the unity between Batten Mayou and Tay-Sachs diseases is still unsolved A unity between Tay-Sachs disease and Niemann-Pick's disease is indeed based on better evidence, for the two affections may be present in one and the same patient—as has been reported repeatedly of late—and the age distribution, course and racial predilection are similar The Schuller-Christian disease also has many points of similarity But to extend this clear cut group of lipoid disturbances to include such affections as Gaucher's disease and the Hurler syndrome, with their different age distribution, course, and absence of racial affinity opens a large field in which it would be wise to let theory wait on observation

A CHRISTMAS APPEAL

The veteran president of the Royal Medical Benevolent Fund writes again to ask readers of the *British Medical Journal* for contributions towards one part of the work of this charity—namely, the distribution of a Christmas gift of 30s to each of the beneficiaries on its books The number of these is usually between 600 and 700, they are infirm or invalid doctors or the widows or daughters of deceased medical men, whose incomes are not even £100 a year The gifts for which Sir Thomas Barlow appeals on page 825 will provide a little additional warmth or clothing for many who dread the winter months, or brighten a poverty-stricken home with some small pleasure Donations should be sent to the Treasurer, R M B F, 11, Chandos Street, Cavendish Square, London, W 1

The Lloyd Roberts Lecture is to be given by Professor Miles H Phillips of Sheffield on "The Prevention of Puerperal Fever" at St. Mary's Hospital Whitworth Street Manchester, on Tuesday, November 9, at 4 15 p m

acid themselves and yield an acid protein free filtrate. Only the last of these groups was of interest to us and we found in fact, that treatment of minced-meat, liver, etc., with an adequate amount of trichloracetic acid precipitated the whole of the protein, with which was carried down all or practically all the fat By grinding the protein- and fat-containing material with an equal volume of 10 per cent trichloracetic acid solution, allowing the mixture to stand for a few minutes, and then filtering through a Büchner funnel we obtained a water-clear filtrate, which was to all intents and purposes free from protein and fat. The time involved, including the filtration, was about three hours, and the final solution was better for the purpose in view than that obtained by the Stas Otto process in three days The filtrate was acid, and would *therefore be expected to contain any alkaloids present in* the original material, along with any water-soluble but non basic substances such as barbiturates and (most) glucosides Qualitative tests showed that this expectation was realized, that added alkaloids were present in the trichloracetic acid extract, and that no more could be recovered from the insoluble residue Thus, so far at least as the substances we have as yet tested are concerned, the first part of the problem has been solved In the extraction of alkaloids a method of preliminary treatment has been found which is superior to the Stas Otto process Further work in progress will decide whether it is of universal applicability

Strychnine Adsorption on Kaolin

We wished to avoid the necessity for evaporating the acid filtrate obtained in precipitating proteins, etc, by trichloracetic acid, and therefore concentrated our attention on the possibility of adsorbing alkaloids on a solid medium For our preliminary experiments we chose strychnine as an alkaloid which is relatively stable and for which sensitive colour reactions are available Of a number of substances tested, kaolin (British Drug Houses' levigated powder'), franconit, charcoal (Merck's medicinal), and aluminium oxide (Merck's nach Brockmann') were found to be very efficient in adsorbing strychnine from a slightly acid solution of its hydrochloride When 25 c cm of a solution containing 50 mg of strychnine hydrochloride were shaken for a few minutes with 5 grammes of any of these adsorbing agents and the mixture was then filtered, the filtrate did not retain enough alkaloid to be detected, after evaporation, by Mayer's reagent or by sulphuric acid and potassium dichromate It had therefore been completely adsorbed On the other hand fuller's earth like certain other brands of kaolin charcoal, and aluminium oxide was relatively ineffective

Our choice of kaolin as the adsorbent to be used in further work was based on the finding that it adsorbed many other alkaloids with great ease and was much cheaper than either franconit or Merck's adsorbent aluminium oxide (which were however equally effective) Charcoal we discarded, since we feared that it might cause oxidation of some of the less stable alkaloids Our impression of the efficiency of kaolin was confirmed while our work was in progress by the results of Mutch (1937) who was interested in the use of kaolin medicinally in cases of food poisoning

Elution of the Strychnine

The next step was the elution of the adsorbed alkaloid Certain facts suggest that like many other substances alkaloids are adsorbed as such by basic adsorbents although they are present as salts in the original solution It is possible, therefore, that after thorough washing of the kaolin plus alkaloid the latter might be removed by simple extraction with a suitable organic solvent We have not yet tried this, since the removal of the last traces of the original acid solution requires very thorough washing, and, partly on account of the time involved and partly for fear of losses during the washing we used a shorter process We filtered off the suspended kaolin with its adsorbed alkaloid on a Büchner funnel, washed once with water and ground with a little 10 per cent aqueous sodium carbonate solution (using enough to make the suspension neutral or slightly alkaline) The paste so formed was then mixed, by grinding, with anhydrous sodium sulphate to give a dry powder, which was extracted with chloroform in a Soxhlet apparatus Early *experiments with this technique gave bad results, since* a certain amount of coloured matter was extracted from the kaolin Preliminary treatment of the kaolin by washing with alcohol, chloroform, and finally with ether, removed this difficulty and did not impair the adsorbing power of the kaolin All kaolin used in subsequent experiments was treated in this way before use

Using the washed kaolin, this method gave almost quantitative yields of strychnine from simple solutions of the hydrochloride An alternative procedure, equally effective in the case of strychnine but less so with other alkaloids, was to suspend the kaolin plus alkaloid in dilute aqueous sodium carbonate and extract the suspension repeatedly with hot chloroform The chloroform extract, however, did not separate very clearly, and in any case had to be filtered to remove particles of kaolin before being evaporated The dry extraction method was therefore regarded as the standard procedure, although for *qualitative* purposes the wet extraction process is quicker and simpler

The next step was to attempt the isolation of strychnine from a large excess of protein, fat, etc., using the method already described for removing the protein and fat For this purpose a dilute solution of strychnine hydrochloride containing 50 mg of the hydrochloride (equivalent to 41 mg strychnine) was thoroughly mixed with 400 grammes of minced meat After standing overnight this was thoroughly ground with 400 c cm of 10 per cent trichloracetic acid After filtration on a Büchner funnel the well-pressed precipitate was again ground with 100 c cm of the trichloracetic acid solution and refiltered The two water-clear filtrates were combined and shaken with about 10 grammes of the washed kaolin After an hour the kaolin was filtered off and submitted to the eluting process In one experiment using the wet extraction method, 36 mg of strychnine were recovered (an 88 per cent yield) in another by the dry extraction process 40 mg of strychnine were obtained (a 97 per cent yield) These yields were not exceptional and the product was pure as shown by melting point ignition tests etc Admittedly the quantity of strychnine involved in these experiments was large but with as little as 5 mg of strychnine hydrochloride present a recovery of 73 per cent was obtained and from only 1 mg enough to give a strong qualitative reaction by the sulphuric acid–potassium dichromate test

Results with Other Alkaloids

Using the same method equally good results—that is recovery of 80 to 95 per cent of the quantity added—were obtained when morphine or quinine in amounts as small as 10 mg was mixed with minced meat With nicotine and aconitine (tric aconite *B.P.C.*) no quantitative experiments have been done as yet, but when minute

percentage of oxygen and other treatments for shock are indicated in serious cases

Picrotoxin is the specific antidote for barbiturate poisoning, but if injected too quickly or in excessive dosage it will produce convulsions, the treatment for which is an intravenous dose of a barbiturate An unimpaired liver function is essential for the normal detoxication of a barbiturate Apomorphine, 1/40 to 1/60 grain, aborts scopolamine reactions, coramine may be a useful temporary stimulant in cases of avertin depression It is much safer, however, to place no reliance in analeptics and to be more careful in assessing the sedative dose for each individual patient.

Another serious risk which should be mentioned here is the existence of a partially obstructed airway This can kill a patient from anoxia just as surely as can complete respiratory obstruction, and since it is so commonly overlooked it may be even more dangerous When the breathing is depressed any further reduction of the alveolar exchange—such as occurs in the presence of an obstructed airway—immediately produces respiratory failure without any intervening period of respiratory stimulation

Overdose of the Anaesthetic Agent

When the breathing is shallow or has stopped there is a high alveolar content of carbon dioxide as a result of insufficient pulmonary ventilation The respiratory centre is, however, so depressed by the anaesthetic agent that its threshold has been raised above the point at which this high concentration of carbon dioxide can, so to speak, ring the bell. At the same time the insufficient respiratory exchange is failing to supply the body's requirements of oxygen, and anoxia itself will cause respiratory failure

No more anaesthetic must be given until the situation is relieved, an atmosphere rich in oxygen being substituted after the patency of the airway has been verified If respiratory movements are inadequate or absent a two-gallon bag should be filled with pure oxygen, an accurately fitting mask applied to the face, and the lungs rhythmically inflated by manual squeezing of the bag A rapid recovery usually results If this procedure has to be at all prolonged the bag must be emptied to remove the accumulation of exhaled anaesthetic and carbon dioxide, and then refilled with pure oxygen When it appears that the circulation has also been brought to a standstill by the high concentration of the anaesthetic agent treatment for primary cardiac failure must be instituted unless there is a prompt response to artificial respiration

If pre-anaesthetic sedatives have been given the failure is due to the combined depressant action of these and the inhalation agent Recovery will naturally be more prompt when the major part of the depression has been evoked by the inhalation agent, since a volatile anaesthetic can—provided the circulation is reasonably efficient—be removed as rapidly as it has been introduced When, however, the failure has been produced entirely with non-inhalation agents, such as intravenous pentothal or evipan, all that artificial respiration can do is to maintain life until such time as the body itself has detoxicated the drug This unwelcome state is apt to arise when the operative stimulation has ceased, and again emphasizes the importance of not using these powerful drugs in a haphazard fashion In these circumstances, as there is no inhalation anaesthetic to be eliminated, only carbon dioxide accumulates in the bag of oxygen, if a canister of soda-lime is in position between the mask and the rebreathing bag there will be no necessity to empty its contents during the period of artificial respiration When oxygen has been administered freely throughout an operation its use must be discontinued gradually, otherwise respiratory failure may occur before the patient has had time to readjust himself to atmospheric conditions

Sometimes in cerebral cases and other poor operative risks patients cease to breathe as soon as they lose consciousness Their general condition will be kept nearer normal if anaesthesia is induced and maintained by a manually produced respiratory exchange rather than if carbon dioxide is continually added with the idea of making these patients breathe

A patient with chronic laryngeal obstruction has become accustomed to a high alveolar content of carbon dioxide, and his respiratory centre has adjusted its threshold accordingly After the obstruction has been relieved the alveolar content of carbon dioxide at once returns to normal, and the patient may die of oxygen want before his respiratory centre is stimulated The administration and gradual "tapering off" of carbon dioxide as his respiratory centre readjusts itself to the normal threshold will prevent such a tragedy It is all a question of the difference between threshold and stimulus, a similar state of affairs may be seen following overventilation due to nervousness during induction (acapnia) or after the stopping of an anaesthetic in which carbon dioxide has been allowed to accumulate by rebreathing The depressed and possibly irregular breathing of respiratory failure must be distinguished from the shallow or hesitant breathing of too light an anaesthesia

(The conclusion of this article, which will appear in the next issue of the *Journal* deals with respiratory obstruction primary cardiac failure, circulatory depression, convulsions, and 'other risks")

SOME FACTORS IN NUTRITION

A special Chadwick Lecture on the study of nutrition was given in London on October 14 by Professor W. A. Osborne, dean of the faculty of medicine in the University of Melbourne He attributed the increasing interest taken to-day in national and personal nutrition to seven causes (1) the great war with its problems of food supply and the evidence found on examination of recruits, (2) public imagination caught by vitamin research, (3) economic success of scientific feeding of farm animals, (4) propaganda by food manufacturers, faddists and quacks (5) increased resort to dietotherapy by the medical profession (6) the widening democratic outlook (7) prosecution of nutritional research

Outlining the physiological aspect of dietetics the lecturer said that the sliding scales of calorie intake prepared by the League of Nations and by special committees were useful as working standards of minimal requirements but the optimal was hard to fix owing to varying race work, and climate, and the individual idiosyncrasies of human creatures The importance of the rate of liberation of energy was often forgotten nitrogenous fuel food was more explosive, hence the killing power of the carnivora Human instinct was a factor that played a part in nutrition though it was inferior to the instinct in lower animals The lecturer named as examples of instinct—salting of soup distribution of calories over the three types of fuel foods nausea when canned meat was taken for some time, and the instinctive liking for celery and salads. Speaking of drawbacks attending food enlightenment of the public he suggested that people might become food conscious though this was contrary to Anglo Saxon tradition Exaggerated claims were made for improved nutrition—for example, that it would stop dental decay It was forgotten that milk was not essential for adults, except mothers. Children in slums, even if fed correctly, would still be anaemic if they had inadequate sleep due to crowded and verminous beds Neglect of social factors also delayed right education as to feeding. A man was not an isolated unit, the meal was a strong social bond Disregard of aesthetic factors often prevented enjoyment of food, nutriment enjoyed was better digested

distension that occurs in conjunctival chancre, or ordinary gnat bite, or erysipelas of the upper part of the face The last mentioned disease is, of course, one of the diagnostic pitfalls in this region, because herpes zoster ophthalmicus patients have often been labelled with the diagnosis of erysipelas In spite of repeated textbook warnings this mistake is not unknown to-day Confusion is most likely to arise during the early stages, in which there may be spreading oedema and redness of the skin of the eyebrow and upper lid before the characteristic distribution of the zoster rash has manifested itself

An interesting result of less sudden swelling of the lids is provided by the condition of blepharochalasis, which was first described by Fuchs in 1896 Since that time a number of cases have been collected and commented on in different countries by many observers, including Benedict so that it is now well established as a clinical entity The onset is, as a rule, soon after puberty The upper lids become swollen, at first intermittently, for perhaps a few hours, and then the patient may be free from signs for a few days or even weeks As time goes on, however, the attacks tend to last longer and longer These repeated attacks of distension lead to permanent changes in the skin consisting of redness, thinning and bagginess Both the upper lids are usually involved sooner or later, even if at first the condition should be unilateral In long standing cases ptosis may supervene, and the skin often becomes creased into innumerable fine wrinkles There has been much speculation concerning the radical cause of this complaint which has been closely compared with angioneurotic oedêma

Chemical Irritants

One result of the recent great advances in synthetic chemistry has been to multiply the number of compounds which are known to injure the skin Thus new industrial diseases are constantly arising to replace some of those which have been eradicated by the enormous improvements in factory conditions brought about during the last two decades To such substances the eyelids may react in two ways first, from direct local irritation, secondly, as the expression of an allergic reaction involving their skin before the less delicate skin elsewhere has yet become affected Certain face powders and other cosmetics have been known to produce acute blepharitis in both these ways Orris root in shampoos has sometimes caused severe and prolonged oedema of the lids Hair dyes, certain plants, scents, vapours, and even turpentine in paint may have the same disturbing result among susceptible people, so that the explanation of an attack of blepharitis sometimes requires much ingenuity

The intolerance displayed by some people towards atropine and other mydriatics is variable in amount, and may be so severe as to simulate erysipelas It may arise on the first day that the drug is administered, or it may only supervene after long-continued application It has often been noticed that many of the patients who develop atropine irritation showed a similar intolerance for each successive drug administered as a substitute for atropine—for example hyoscine, duboisine, and homatropine This clinical observation would now appear to find a rational support in recent work done by Ridley He maintains that not only is irritation from a mydriatic predictable by means of a skin test but that the different mydriatics have a definite quantitative relation to each other so far as their irritative capacity is concerned By means of specially prepared serum atropine, experimental immunization against this intolerance has been effected In the course of his paper which was read at the Ophthalmological Society of the United Kingdom Congress this year, Ridley emphasized the extreme rarity of atropine intolerance in the absence of some congestive disease of the eye

Blepharitis

Dermatologists and ophthalmologists have now for a long time been aware that blepharitis is often the result of and indeed an actual part of, the condition of seborrhoea, or, less often, of pityriasis The seborrhoeic facies accompanied by blepharitis is particularly well marked in post-encephalitic Parkinsonism, as has been pointed out by Krestin and others In the still more serious condition of sycosis the eyelids may suffer so badly that the resulting blepharitis may persist long after the sycosis has settled down In small children a large proportion of the worst cases of chronic blepharitis begin during convalescence from measles In view of the grave disfigurement and severe disability which may be occasioned by long-continued blepharitis it is of the utmost importance that the therapeutic resources of these two branches of medicine should be pooled The disfigurement is mainly due to loss of eyelashes combined with redness of the lid-margins As a result of chronic scarring in this neighbourhood the sharp lid margin tends to become obliterated into a rounded line, so that the lower lid is less accurately apposed to the globe There is also some displacement of the lower punctum, and these two factors combined lead to interference with the normal drainage of tears The ensuing epiphora may become further aggravated if the patient repeatedly wipes the lower lid in a downward direction Chronic dermatitis may develop in the adjacent skin, so that a vicious circle is set up Moreover the growth of the remaining eyelashes may become so distorted that they scratch the eyeball in the act of blinking thus causing aggravation of the existing conjunctivitis as well as recurrent attacks of keratitis

Concerning the immediate local treatment of blepharitis there are two main desiderata first that any crusts accumulated at the roots of the lashes should be removed, secondly, that the skin of the eyelids should be treated as gently as possible Admittedly the thorough removal of inspissated secretion from the lid margins makes some manipulation inevitable, but this can be kept within reasonable bounds if precautions are taken to soften the crusts by preliminary sponging with clean cotton wool soaked in warm water Sponging should of course be in the direction of the eyelashes and not transversely Repeated application of strong chemicals is assuredly wrong treatment in the great majority of cases It may reasonably be argued that a preliminary painting with some mild caustic such as silver nitrate or protargol is of benefit in selected cases but in my opinion it is impossible for the skin in this situation to tolerate the frequently repeated application of such substances There is no need for any large list of lotions Sodium bicarbonate (2 per cent) perchloride of mercury (1 in 15 000) and normal saline solution will cover the needs of most cases so far as lotion is concerned As the individual response of patients is so variable benefit can be obtained by changing the lotion from time to time especially where progress is disappointingly slow Where there is much dermatitis of the neighbouring skin the utmost care must be taken not to let excess lotion flow over Careful sponging is more to be recommended than sluicing from an undine Strong ointments should be likewise avoided In most cases petroleum jelly is as likely to do good as any of the more complicated remedies

3 WHAT MEASURES MAY BE EMPLOYED FOR HER SAFE RETURN TO DUTY?

Such cases as are swab-positive would appear to fall into three groups

(i) *Those with Apparently Healthy and Normal Upper Air Passages on Examination*—These would be labelled by Okell and Elliott (1936) as "latent," and may be due to recent exposure to infection, in which case they rapidly become negative They should first be examined by an ear-nose-and-throat surgeon, and if he cannot find any reason for the swab-positive condition then they should be sent to the seaside and instructed to perform a toilet daily with painting and gargling Such cases have in our experience rapidly become clear If, however, they do not do so, then enucleation of the tonsils and adenoidectomy should be considered

(ii) *Those who on Examination Show an Obviously Unhealthy Nasopharynx or Chronic Sinus Disease*—In this case they should be subjected to surgical intervention, if necessary followed by a seaside holiday

The following case is an excellent example of this

Midwife D had two cases of streptococcal puerperal infection occur in her practice, and a swab from her throat was shown bacteriologically to produce a fairly profuse growth of *Str pyogenes Type 5 She failed to respond to* conservative treatment, and a further swab showed if anything a more profuse growth of the organism than before In view of this the presence of an infected sinus was suggested, she was operated upon, and an infected antrum drained and her tonsils removed Two weeks later, to our disappointment, a further swab gave a profuse growth of *Str pyogenes* but this proved to be Type 28 This was considered to be a superimposed infection, which turned out to be the case, as the swabs gave successive scantier growths of *Str pyogenes* They eventually became negative, and she returned to work

(iii) *Those Obviously Suffering from an Acute Infection such as Tonsillitis*—These usually become non-infective after the acute stage is past, but in view of the fact that scarlet fever is still isolated for at least six weeks it is illogical to isolate such cases for less, as they are due to the same organism They must, however, even then await the advent of negative swabs, and again our impression is that a period of convalescence at the seaside will hasten events If, however, they remain persistently positive then they should be examined as mentioned above

In connexion with the examination by the ear-nose-and throat surgeon we have found the following report form extremely useful

1 Is there chronic infection of the tonsils and adenoidal tissue?—If suspected please swab, and forward swab to the above address

2 Is there any evidence of sinus infection?—If suspected please send a swab of washings as above

3 Is there any other focus of chronic infection due to the *Str pyogenes* which we have isolated?

4 Please will you suggest treatment, as it is absolutely essential that any possible source of the organism should be cleared up

We would mention that, as might have been expected in view of the type of lesion, prontosil in these cases has been of no value in clearing up these so called carriers

Conclusions

1 It would appear essential not only for the benefit of the patient but also in the interest of the attendants, that all cases of pyrexia during the puerperium should be investigated as a routine

2 If in the course of this investigation one of the attendants is found to harbour the *Str pyogenes* in his or her throat or air passages then work in midwifery should be suspended until the attendant is bacteriologically negative, whether shown to have been the actual cause of the infection or not, this would also apply to streptococcal infections in the midwifery practitioner

3 Although such rules would appear very stringent at first sight the prospect of obtaining the swab negative state is not so gloomy as might be imagined

4 The swabbing of clinically normal throats, unless they are believed to be a source of infection, cannot be too much deprecated

I wish to thank Dr F Griffith of the Ministry of Health Laboratory for his help and for supplying the serum used in typing

VENEREAL DISEASE IN THE U.S A.

PLANNING AND RESEARCH

The social and medical problems of venereal disease in the U S A have stirred the medical and the public conscience during the past year or so, and in December, 1936, a conference on its control was addressed by the Surgeon General, U S Public Health Service, Assistant Surgeon-General R A Vonderlehr, who is in charge of the Division of Venereal Diseases, and many well-known medical authorities [1] Although syphilis was made reportable in 1919 there is little or no evidence to show that it is on the decrease, and the same applies to gonorrhoea It is clear that the situation is unsatisfactory and that the United States is far behind Great Britain in its system of control of venereal disease Energetic steps are now being taken to grapple with the situation, and the Social Security Act has given an impetus to the public health measures and put more funds at the disposal of the authorities

The views and recommendations expressed at the conference were on lines familiar to workers in this country But it is noteworthy that nothing was said about prostitution, either open or clandestine, the importance of which is so much stressed in many European countries [2] It is doubtful whether much can be done to reduce the number and infectivity of these women Syphilis appeared to attract more attention than gonorrhoea, but those who addressed the conference on gonorrhoea pointed out that it is no less important than syphilis, that it is more prevalent, and that the same preventive measures are applicable to both

Education of Doctor and Patient

In general the recommendations were on stereotyped lines Notification, if it could be carried out efficiently, would be a great help, but so far it has been only partial, and it is difficult to see how it could be strictly enforced Education seems to have been the keynote First, the public should be taught to recognize these diseases and their gravity, and be informed of the importance of early treatment and the necessity for continuing up to complete cure—or at least until no longer contagious Secondly, time should be found in the curriculum for the instruction of students and for postgraduate classes and courses for qualified medical men The average practitioner knows little or nothing of venereal disease, and there are but few trained specialists

impressed with the frequency of the story of life long vasomotor disturbance, varying from what is generally called a fresh complexion to marked vasomotor instability often associated with acrocyanosis and hyperidrosis of the extremities In the young this disability is quite tolerable, but towards middle age the high colour tends to become fixed on account of permanent enlargement of the skin capillaries, and it may be aggravated by secondary factors In the normal skin even this is not disagreeable, but in seborrhoeic subjects the persistent congestion of the face is often complicated by hypertrophy of the sebaceous glands, leading to rhinophyma and to acneiform pustular infection In excessively dry and delicate skins to the rosaceous erythema may be added diffuse scaliness or a small dry papular eruption

Causes of Rosacea

These changes appear to take place occasionally in perfectly healthy subjects, though unquestionably they are often aggravated by gastric disorders and other factors among the latter the most important seem to me to be faulty diet and hygiene For example, I have in mind a personal acquaintance, a large man of fresh complexion whose face was grossly disfigured at a comparatively early age by chronic rosaceous erythema, blepharitis, and acneiform infection On the advice of one of my colleagues he put himself on a strict diabetic diet The improvement was dramatic, and to the best of my knowledge he has not relapsed during the course of over ten years, though the high colour naturally persists He was a fairly common type, but rosacea is quite often seen in subjects of feeble constitution especially those who spend the greater part of their lives indoors It is among this class that excessive tea-drinking may often be an important factor I remember the case of a housekeeper who from the beginning of the year to the end only went out of doors to shop, except for an annual holiday, during which her gross acne rosacea could be relied upon to clear up I have seen many other cases of the same type respond to a holiday in the open air I am not referring of course, to the vascular background which always persists to some extent

Dr Sybil Eastwood found symptoms of gastric disturbance in 95 per cent of the cases of rosacea she investigated and a low hydrochloric acid curve in 48 per cent , she believed that the effect of a low acid secretion was important only in so far as it affected gastric motility This group responded best to treatment They remained well so long as they continued to take hydrochloric acid with their meals followed in some cases by alkali one and a half to two hours afterwards She also found diet as important in treatment as the correction of secretory defects.

Brown observed symptoms of gastric disturbance in 61 per cent of his cases but while previous investigation of a smaller number by Ryle and Barber had led him to expect a high proportion with low acid secretion he found achlorhydria or hypochlorhydria in only 30 per cent and this percentage was actually lower than that occurring in a miscellaneous collection of other dermatoses It would appear therefore that gastric disturbance associated with achlorhydria or hypochlorhydria is important in only a small proportion of rosaceas The menopause during which vasomotor disturbance may be accentuated is also the principal cause of some rosaceas From my own experience I would place the various causes of rosacea in about the order of their relative importance as follows

1 Vasomotor instability constitutional, and often inherited This appears to be the background in the majority of rosaceas

2. Vasomotor instability, aggravated on the face by gastric or gastro-intestinal disturbance , by faulty hygiene including excessive tea-drinking, alcoholic excess, faulty diet, and lack of recreation in the open air

3 The same factors in the absence of constitutional vasomotor instability

4 Vasomotor changes associated with or aggravated by the menopause

In seborrhoeic subjects these vascular changes may be complicated by rhinophyma and acneiform pustulation—acne rosacea—so that seborrhoea or kérose (Darier) is an additional factor

Eye Complications

So far as eye complications are concerned, I have had a certain number of cases of rosacea keratitis referred to me from the eye department at St. Thomas s Hospital Among these I have noticed at least as many cases belonging to the first group I have mentioned as in the others, and in a good many of them the rosacea has consisted of no more than telangiectases of the cheeks and nose Some of these patients have accepted the gradual rosaceous enlargement of their cutaneous vessels as a normal event in their lives, and I am inclined to agree with them

This leads me to ask a question, the answer to which I hope to obtain to-day—namely, what is the exact relation of rosacea to its corneal complications? In several cases of rosacea I have noticed, in the complete absence of infection of the skin or of blepharitis, congestion of the conjunctiva of the lower eyelids This I have regarded as a direct extension of the vascular hypertrophy which affects the face Is it possible that excessive vascularization alone of the conjunctiva of the lower eyelid may lead eventually to these eye changes?

Blepharitis

With regard to blepharitis I would like to draw attention to a small point in terminology about which I believe some confusion exists Many years ago Sabouraud at one of the Annual Meetings of the British Medical Association drew a sharp line of distinction between seborrhoea and dandruff Seborrhoea he defined as an excessive flow of sebaceous secretion which he thought would be better termed steatorrhoea All types of scaliness of the scalp he said, should be rigidly excluded from seborrhoea The term seborrhoea sicca is however, still used for dandruff and will probably continue to be used rather than the more correct pityriasis simplex capitis or dandruff Personally I have examined the scales of dandruff many times and have always found them fairly obviously to be epidermal scales, with or without droplets of fat according to the degree of the oiliness of the skin Generally dandruff is accompanied by seborrhoea perhaps because seborrhoea favours the growth of the pityrosporon of Malassez There appear to be two main types of blepharitis

The first type is seborrhoeic blepharitis in which the margins of the lids are mildly inflamed and the bases of the lashes surrounded by crusts which I take to be inspissated secretion This condition is occasionally accompanied by dry dermatitis of the eyelids and sometimes by dandruff with or without seborrhoeic dermatitis in the scalp or elsewhere It is certainly difficult to clear

examined by dark-ground and serum tests, and that the U S A is far ahead of most of the world in the thoroughness of its cerebrospinal fluid examinations

Stokes and Usilton claim that the continuous system produces better serological results after the third month than the intermittent, and that it causes no more serious reactions In this connexion it is interesting to note that Great Britain showed a higher incidence of jaundice than any other country although jaundice is usually thought to be due to an idiosyncrasy on the part of the patient, might it not also be connected in some way with climatic conditions?

Patients who have completed adequate courses of treatment of either kind have a 10 to 1 chance that nothing untoward will happen in ten years, with inadequate treatment the chance drops to about 4 to 1 It is concluded, therefore, that in an adequately treated case which has responded satisfactorily all that is necessary is an examination of the cardiovascular system in the 5 to 10 year period after the completion of treatment, but any patient who has shown a tendency to relapse, and any woman who may become pregnant, would be wise to remain under prolonged and repeated observation

Asymptomatic Neurosyphilis

The importance of asymptomatic neurosyphilis is stressed by a number of authors in a survey[6] of 712 (13 5 per cent) of a series of 5,293 patients whose cerebrospinal fluids were examined Those less severely affected —only with increase in the number of cells and globulin— respond more readily and require less treatment than those with a positive or strongly positive Wassermann reaction and a paretic type of gold curve The scheme and amount of treatment in the early stages was found to have marked effect on the occurrence or otherwise of asymptomatic neurosyphilis Where more than twenty injections of arsenic and twenty of a heavy metal were given by the continuous method the incidence of asymptomatic neurosyphilis was 7 5 per cent, but where the treatment was irregular in the acute stage the incidence was 22 6 per cent There was no evidence that the modern treatment of early syphilis predisposes to neurosyphilis

Reaction of the Cerebrospinal Fluid

It is of interest to note that in this series 14 per cent of the patients had a negative Wassermann reaction in the blood and a positive in the cerebrospinal fluid, a fact which emphasizes the importance of examination of the latter On the other hand, it was observed that Wassermann-fastness in patients who had had syphilis for more than four years and had been inadequately treated was accompanied by abnormality in the spinal fluid in 75 per cent of cases Treatment by routine measures, supplemented in some cases by intraspinal therapy, tryparsamide, and malaria, reversed the fluid to normal in 364 (64 4 per cent) of 565 cases by the end of ten years Of these, three showed signs of clinical neurosyphilis and twelve other manifestations, so that even a negative cerebrospinal fluid does not guarantee cure

This study illustrates several points which all syphilologists should take to heart Thorough treatment of early syphilis will reduce the risk of the central nervous system being involved Whether or no the blood *is negative*, a cerebrospinal fluid examination should be made by the sixth month, if negative, it should be retested when treatment is completed, if positive, it should be retested at intervals and its reaction to treatment noted In the light of recent work by Nicol and Hutton[7] it seems that when a positive fluid shows a tendency to be of a paretic type malarial therapy should be instituted without delay, in this way many a patient may be saved from general paralysis of the insane

Nova et Vetera

OLD MEDICAL MSS AND BOOKS

Messrs Davis and Orioli of 37, Museum Street, W C 1, have issued a comprehensive catalogue devoted solely to rare books and manuscripts on science and medicine, which runs to 667 items, all of them interesting and many of them extremely rare and valuable Among the MSS there is a *Canon Medicinae* of Avicenna, translated from the Arabic into Latin by Gerardus Cremonensis the younger, and written on vellum in the fourteenth century It is in the original monastic binding of oak boards covered with white leather, with metal studs, and is catalogued at £85 A collection of medical tracts written in Germany in the fifteenth century includes the *Tabula Ingeniorum* of Bernardus de Gordon, a Scot who was in practice at Montpellier, 1285 to 1307 Another fourteenth century manuscript on vellum contains a work on chess by Cessolis, with a textbook of eye diseases by Peter of Limoges (d 1306), which reached print about 1470—a longer run than modern textbooks achieve this is valued at £125 Then there is a sixteenth century pharmacopoeia with an interesting section of fifty six pages on the treatment of syphilis, in stamped calf, which is followed in the catalogue by a fourteenth century edition of three of the works of Rhazes Less ancient, but equally interesting, is an autograph MS by Siegmund Freud written in 1904, stating the case for psychoanalysis as he was then teaching it

Medical Incunabula

There are no fewer than twenty-seven incunabula (books printed not later than 1500) Albertus Magnus is nominally represented by a treatise on gynaecology published in that year, but thought to be probably the work of another thirteenth century physician Alexander Benedetti's book on the plague—the first edition, printed at Venice in 1493—is of extreme rarity Avicenna's *Canon Medicinae*, an MS of which has already been mentioned, is represented by an edition of 1490, also from a Venetian press, and by another copy of 1498 from Lyons Another plague book is that of Roland Capellutus—the third edition, Rome, *c* 1487 A compendium of surgical tracts (Venice, 1500) contains Isa Ben Ali's treatise on diseases of the eye of the tenth, and Aboul Cassem Omar's of the eleventh century Isidore of Seville's encyclopaedia of medicine and all the other sciences, published at Augsburg in 1472, is in the original monastic binding and is listed at £85 Another compendium Venice, 1497, contains several tracts on various branches of medicine by John Savonarola, professor of medicine at Padua and Ferrara, and grandfather of the famous preacher and reformer From Venice also are Ugo Benzi's Commentary upon Galen, the rare second edition, and Matthew Silvaticus's dictionary of medicine, both of these 1498 Earlier yet is Valescus of Tarentum's book on epidemics and plague, published at Basle about 1474

Sixteenth and Seventeenth Century Books

From succeeding centuries we can mention but a sprinkling Six attractive editions of Vesalius on anatomy are notable, ranging from 1543 to 1603, the most desirable is perhaps the English translation by Nicholas Udall, published in London in 1552—this is priced £175, and is described as being in very good condition An Aldine Galen, 1525, is said to be the first complete edition of his works, and is valued at £90 Hippocrates is represented by less ancient and quite inexpensive editions An interesting book on typhus fever is the *Tractatus de Petichiis* by V Bonagens, Venice, 1536, which describes the devastating epidemic in the French Army before Naples in 1528, when 30,000 deaths took place The

H INFLUENZAE MENINGITIS

BY

H W EVERLEY JONES, M B, M R C P

Registrar to the Children's Department St Thomas's Hospital

In view of the recent interest shown in this condition it seems fitting to record the following six cases which have been treated in St Thomas's Hospital during the last fifteen years The records of all departments of the hospital have been reviewed but the only cases found were those in children no adult cases being recorded

Case 1

E H a female aged 1 year 3 months and a two months premature baby, had had bronchopneumonia at 10 months She was admitted on July 23 1922 with one day's history of malaise restlessness and stiffness She had vomited once

State—Temperature 103 3, pulse 144 respirations 35 Drowsy but irritable when roused The anterior fontanelle was tense There was a moderate degree of neck rigidity and occasional convulsive movements of the right hand No other physical signs were present and the lungs were clear The cerebrospinal fluid was turbid and under raised pressure A very large number of cells were present nearly all polymorphs *H influenzae* was seen in a direct smear and on culture Blood culture showed *H influenzae*

Progress—The patient ran a high remittent temperature and in spite of daily lumbar punctures died on August 8, after an illness of thirteen days.

Necropsy—The vertex and base of the brain were covered with plaques of thick yellow exudate There was some degree of internal hydrocephalus and the brain was congested The upper lobe of the right lung was collapsed but there was no sign of pneumonia The liver was large pale and fatty Smears and cultures of the pus showed *H influenzae*

Case 2

J S male aged 11 months was admitted on January 7 1925 with several days history of vague lassitude and irritability Temperature pulse and respirations were normal and meningitis was not suspected until January 20 when he had in addition to the above definite neck rigidity and his temperature began to rise (101) A lumbar puncture revealed a cerebrospinal fluid which was under raised pressure and was slightly turbid Microscopy showed pus cells ++ and no organisms were seen in a direct smear On culture *H influenzae* was shown to be the causative organism His blood serum agglutinated *H influenzae* in a titre of 1 in 100 He was lumbar punctured six times during the next nine days but became comatose and died on January 29 his temperature rising to 106 before death The duration of the disease was about twenty five days

Necropsy—There was a thick yellow exudate on the base of the brain and some purulent patches over the vertex *H influenzae* was demonstrated in the exudate The other organs were normal except for a pale fatty liver

Case 3

M S a female aged 8 months a perfectly normal child fell off a chair on to her head on March 21 1930 On being picked up she vomited immediately and continued to do so nearly every half hour She was admitted to hospital on March 22

State—Very drowsy temperature 101 pulse 142 No other physical signs were present On March 23 the pulse rate rose to 200 and the temperature became subnormal She became comatose and died after a total illness of two days

Necropsy—There was a purulent meningitis chiefly basal No organisms were found and there was no cranial fracture *H influenzae* was isolated from the exudate

Case 4

W N., a male aged 2½ months was a six weeks premature baby breast fed For two weeks he had had a cough which was becoming worse During the last few days he had been restless and for two days his stools had been green There was no one in the house with influenza He was admitted to hospital on June 15 1933

State—Temperature 98 4 pulse 175 respirations 80 Distressed, breathing shallow faintly cyanosed The chest showed diffuse coarse rales and rhonchi He was treated in the open air and given stimulants and expectorants but showed no improvement On June 24 the temperature had risen to 104 5 F the pulse to 196 and the respirations to 140 and he was extremely distressed The physical signs were unchanged On June 27 generalized convulsions started and these persisted until death on June 29 No other physical signs developed The duration of the illness was about twenty-eight days.

Necropsy—There was an excess of turbid fluid at the base and over the vertex of the brain which was soft The lungs showed bronchitis A smear of the cerebrospinal fluid showed *H influenzae* Culture produced *H influenzae B coli* and *Staphylococcus albus*

Case 5

G H., a female aged 1 year was quite normal until three weeks previously when she had a sudden onset of pyrexia with shivering. The patient was admitted to a local hospital looking pale and ill While there she ran a remittent temperature (up to 104) but presented no physical signs She was transferred to St. Thomas's on January 27 1937

State—Temperature 101 pulse 125 respirations 42 Pale lay in bed curled up on her side drowsy but irritable when disturbed fontanelle flat slight degree of neck rigidity, Brudzinski's sign + There were no localizing signs in the central nervous system and the other systems appeared normal The cerebrospinal fluid was clear and under slightly raised pressure On standing, a fine cobweb coagulum settled The cells were increased and were mostly lymphocytes The protein was 0 045 per cent and the chlorides 66 mg. per 100 c.cm No tubercle bacilli were found in the coagulum and the fluid was cultured A radiograph of the chest was negative On the 29th the cerebrospinal fluid was still clear but there was no coagulum and there was a higher percentage of polymorph cells On February 2 she became comatose and without further physical signs died *H influenzae* was seen on the culture plate that day

Necropsy—Thick creamy pus blue green in colour was present at the base of the brain and to a less extent over the vertex A small abscess 1.5 mm in diameter was found just behind the posterior horn of the left lateral ventricle The brain was very soft The pus contained polymorph cells ++ and bacilli identical with *H influenzae* The lungs showed bronchitis The other systems were normal

Case 6

P M a male aged 2 years 10 months was a perfectly healthy child who had spent all his life in the Cromwell Nursery (Mothercraft Training Society) In the past he had had a mild otitis at the age of 14 years His mother had just recovered from an attack of influenza contracted two weeks before He was admitted on May 10 1937 with one day's history of vomiting, screaming and feverishness

State—Temperature 101 4 pulse 120 respirations 58 Flushed lay curled up on his side drowsy but irritable when disturbed Apart from neck rigidity and slight photophobia there were no abnormalities in his central nervous system The ears throat and lungs were normal and the abdomen rather distended The spleen was not enlarged and there was no rash The cerebrospinal fluid was under great pressure and was turbid Polymorph cells were present in large numbers with some endothelial cells No organisms were seen in a direct smear and the fluid was plated out

THE HARVEIAN CELEBRATION

LORD DAWSON ON HEALTH SERVICES

The Harveian dinner of the Royal College of Physicians of London, following the Oration in the afternoon which is printed in our opening pages, was held at the College on St Luke's Day, Monday, October 18 The President, Viscount Dawson of Penn, presided over a company of Fellows numbering between seventy and eighty, and including one lady The President had on his right hand Sir Cuthbert Wallace, President of the Royal College of Surgeons of England, and on his left Sir Ewen Maclean, President of the British College of Obstetricians and Gynaecologists

In submitting the only toast (other than that of "The King"), the health of "Our College," and in making the one speech ordained on this occasion, Lord DAWSON said that the dinner was a little different from its predecessors, because the guests had been restricted to the two representatives of the sister Colleges, who were heartily welcomed Owing to lack of space it had become difficult to accommodate their own Fellows who wished to attend this function, but the Comitia had felt it inappropriate to hold anywhere outside the College a dinner to commemorate Harvey

Hospitality in Harvey's Time

Harvey (Lord Dawson continued) must have been a courageous and buoyant figure In spite of his work—and he was most industrious—and the anxieties that must have surrounded his life in those days of conflict, in spite of the visitation of which the Harveian Orator had reminded them that afternoon, which led to the destruction of records of his researches spread over a considerable time, he retained his capacity for human enjoyment and his interest in the world of play When he travelled abroad he did not hesitate to write accounts of the feasts which he was given Referring to a feast which he had attended he said, I enjoyed much contentment therein with health and mirth" For such jollity he paid a price, for his attacks of gout were severe and recurrent

In those days of the early seventeenth century life must have been a strange blend of culture and crudity of manners When one remembered the richness of the viands of the banquets of those days, present-day dinners seemed to be lilliputian But the guests brought their own spoons with them, and there were no forks To the last the virgin queen handled her victuals with her fingers, a practice which had its own etiquette, for in a book of manners of the period there occurred the following "Take your food only with three fingers and in small mouthfuls" It was not difficult to imagine the food served in front of the guests, the competition to help themselves with their fingers, and, having helped themselves, the struggle to eat without a fork

"When I see the Fellows around this table to night, each caressing the vintage of his choice, I reflect how fortunate we are It was not until the reign of Queen Anne that vintage wine came within the ken of mankind Prior to that time wine was stored in barrels, decanters were only used for the purpose of drawing the wine, the wine was used as a beverage and drunk out of goblets, and although the physicians of that age as now, were well in advance of their times, and sipped Gascony wine out of glasses the barber surgeons drank sack at seven shillings a gallon The bottle of wine did not come in until someone thought of applying a cork and discovered the corkscrew It was not until then—the eighteenth century—that vintage wines were possible Therefore we have some advantages in not living in the good old times'

Harvey's Inheritance Today

Lord Dawson went on to say that if the last twenty-five years were surveyed it could be said that the spirit of Harvey lived amongst us The time was both fruitful and appreciative of research He recalled the work on hormones, on vitamins, on tuberculosis, on gastro intestinal diseases, on the blood and its circulation, in every field the recollection brought to mind a body of workers well worthy of Harvey's inheritance This was well exemplified in the person and work of their own Orator of that day, Sir Arthur Hurst The oration with which he had delighted them was not only learned but alive, it travelled not only vertically but transversely through the world of learning All who heard it must have admired his keen mind, his lively interest, and not least his courage, for they all knew that there were times when during his travelling he had had hard work 'against the collar' When they drank the health of "The College" they would think of the Orator and wish him well

The present dinner must be regarded as in a sense a double event Last year there was no dinner, and therefore a tribute must be paid on this occasion to last year's Orator, Sir Walter Langdon-Brown, for an oration which by common agreement was a learned and brilliant performance Lord Dawson also extended a special welcome to Professor E L Kennaway, to whom the Baly Medal had been presented that afternoon for his work in the realm of biochemistry and malignant growths

Promotion of the Public Health

Beyond its contribution to the maintenance and furtherance of knowledge, the College was concerned with the application of such knowledge to the prevention and cure of disease, and the circumstances of the moment made it appropriate for him to speak of the services concerned with the health of the nation

The promotion of public health (Lord Dawson went on) is something with which in days past this College has been deeply concerned Those roots and the tree which has grown from them were planted and tended by men whose names are honoured on our College roll In the early days health policy was confined to water supplies, drainage, and suchlike environmental conditions, but the time came for the next great landmark, which was the uprising of bacteriology, and with it came a revealing of the causes and of the means of prevention and cure of infectious diseases—in other words, it became possible to study the marauders on man's health, and their circumvention was reflected dramatically in the comparative mortality tables

None the less, this progress in health and the change in health policy which followed it was the work of the medical sciences, and now, in the campaign which was inaugurated by the Prime Minister a short while ago, the emphasis is being laid upon the man himself and the various means whereby he can be reared from infancy to manhood so as to become himself strong in health, with a high capacity for resistance to disease, and able to make his full contribution to a fit race As a result of that we shall regard in the future not only the quantity of people produced but their quality, and we shall not be deceived when we are told that the mortality rates are coming down, and we shall not infer that necessarily all is well

Co-operation of Medical Practitioners

To pass on to the health services, these have been developed one by one, being built up by medical men, and in generous measure by Fellows of this College I may refer to one notable example in our distinguished Fellow, Sir George Newman I should like to point out this, that if the present campaign is to achieve its objects its centre of gravity must be sought inside the medical profession Without that there can be no substantial achievement It is agreed—and here I would refer to two communications in the *Times* from Fellows of this College, Sir Farquhar Buzzard and Sir Walter Langdon-Brown—that the co operation of medical practitioners is essential if there is to be a continuing popularity and extension of

these 71 were over 2 years of age and 97 were under 2 In all I can find only fifty cases of recovery reported including Case 6 above Only four of these were under 1 year old

Treatment

Much controversy has centred round the subject of specific treatment The convalescent serum taken from patients who have recovered from influenza is generally thought to be useless as this disease is almost certainly caused by a filterable virus with *H influenzae* as a secondary invader

Throat strains of *H influenzae* form a heterogeneous group of antigens whereas nearly all strains of meningeal *H influenzae* have similar antigenic properties (Pittman 1933) Pittman also showed that all meningeal strains possessed a similar type of soluble specific antigen derived from the supernatant fluid from a centrifuged culture Serum prepared without the addition of this soluble specific substance has been demonstrated (Wilkes Weiss, 1936) to have little bactericidal action To obtain an efficient antiserum it is essential to use both a fresh strain of the organism and the soluble specific substance Horses have been thus injected in increasing doses and the serum so obtained used in treatment

In this disease Ward and Fothergill (1932) have shown that complement is absent from the cerebrospinal fluid, and so the injection of normal human serum is advised The doses recommended (Ward and Fothergill 1932) are 6 to 8 c.cm of normal human serum plus 15 c.cm of antiserum twice daily—one injection into the lumbar theca and the other into the lateral ventricle Should the blood culture be positive they recommend an injection of 50 c.cm intravenously

The results of this treatment are disappointing Of fifty cases treated in this way (Ward and Wright 1932 Pittman 1933, Huntington and Wilkes Weiss 1936 Ward and Fothergill 1932) only three recovered This shows no improvement over ordinary methods It was noticed however that in several of these patients there was temporary improvement which was not sustained

From these results it appears that treatment on these lines will prove of no avail Repeated lumbar puncture is in our present state of knowledge the only measure of practical use even forced spinal drainage being no more successful Sulphonamide P was given in Case 6 Probably the dosage was not sufficient to enable conclusions to be drawn from the result but the fact that recovery did occur suggests that this drug should be given a further trial

Summary

1 Six cases of meningitis due to *H influenzae* are reported with one recovery

2 An account of the condition is appended

Grateful acknowledgements are due to Dr R C Jewesbury in whose ward all the cases were treated and to Dr J Bamforth who performed the pathological investigations

Clinical Memoranda

Strangulated Hernia of the Ovary in a Child of 6 Weeks

In the *British Medical Journal* of August 7 last, Dr M H Fridjohn and Mr Maurice Lee report a case of strangulated hernia of the ovary in a girl of 3 months and finding that a careful survey of the literature reveals no case of a similar nature in so young a patient, they issue a request for details regarding any comparable case As the father of a child who suffered from strangulated hernia of the ovary at the age of exactly 6 weeks I am in a position to record a case occurring at an even earlier age than that referred to by Dr Fridjohn and Mr Lee Since however, the event in question occurred ten years ago and since I must rely upon my memory (fortunately checked by that of my wife) in attempting to comply with the request for details I trust that due allowance will be made for any inadequacy in my account

At birth the girl in question was a healthy baby of five and a half pounds and showed no signs whatsoever of physical abnormality Her progress was satisfactory until shortly before the development of the hernia when feeding difficulties began to cause some concern It may be confidently stated however that these difficulties were quite independent of the hernia which developed and no vomiting occurred At about 10 a.m on the day on which the child became 6 weeks old the nurse in attendance reported the presence in the left groin of a lump which had not been present when the child was last "changed As in the case reported by Dr Fridjohn and Mr Lee this lump was about as large as a walnut After the lapse of ten years I find it impossible to make any definite statement regarding the consistency of the swelling but my impression is that it was moderately hard It may be definitely stated however that the swelling was situated in the region of the left inguinal canal that when first seen it proved to be irreducible and that the child cried when it was palpated Dr Douglas Miller who had attended the confinement was summoned in the first instance and the child was removed to a nursing home where Mr Walter Mercer operated about 2 p.m The swelling was then found to have been due to a strangulated inguinal hernia of the left ovary to which a developmental cyst was attached The cyst was removed the ovary which was found to be healthy was returned to the abdominal cavity and the canal was closed

The child made a good recovery although some time elapsed before the feeding difficulties already mentioned were satisfactorily overcome Her subsequent health has been excellent and the only other serious illness from which she has suffered was an attack of acute appendicitis necessitating appendicectomy at the age of 8

When the case described is compared with that recorded by Dr Fridjohn and Mr Lee the following features attract attention (1) The hernia would appear to have occurred within a few hours of its discovery (2) a developmental cyst was attached to the ovary (3) the presence of the cyst and the patency of the inguinal canal which enabled the hernia to occur may be presumed to have been congenital (4) in spite of the presence of the [illegible] the affected ovary if was of normal appearance and consequently did not require removal (5) vomiting played no part in the clinical picture

L[illegible] W P D [illegible] D

The Citroen Company displayed its three four-cylinder cars—Twelve, Light Fifteen, and Fifteen—the chief feature of the first two of these being the front-wheel drive and independent front springing by means of torsion rods Various modifications in detail have been made in all three models, the prices of which range from £238 to £298

The principal change in the series of Daimler vehicles is found in the Fifteen, the six-cylinder engine of which is, however, rated at 17-h p Not only is the power unit now mounted well forward to provide for inter-axle seating, but independent front-wheel suspension has been adopted and the wheelbase extended The usual Daimler features of fluid flywheel and self-changing gear are, of course, retained In view of the changes, it has been found necessary to increase the price of the six-light saloon to £475

D K.W , Fiat, and Ford

A newcomer to this country is seen in the D K W car, one of the most popular small vehicles in Germany Its chief features include an 8-h p two cylinder two-stroke engine—the only one of the kind in the Exhibition—front-wheel drive, and independent front springing As a four-seated saloon it is priced at £169

The Fiat cars, which are of Italian design, include an entirely new model known as the 1100 c c Balilla This, while having a four-cylinder engine rated at 11 4-h p , follows the lines of the little car bearing the same name introduced a year ago, and as a saloon is priced at £198, or £208 with a sliding roof

Since last year the 8-h p and 10-h p Ford cars have been largely redesigned , the smaller model has been provided with a new braking system, with the hand-brake lever of the pistol-grip type mounted under the scuttle The frontal appearance has also been brought into line with modern practice, the body space made more roomy, and steel-spoked wheels fitted in place of the former wire type Prices for two and four-door saloons are now £117 10s and £127 10s The Ford Ten has the same modifications introduced in April last, these comprising a longer wheelbase, inter-axle seating, pressed steel wheels and Girling brakes With two doors this car costs £150, or with four doors £162 10s Various alterations have been made in the 22-h p eight-cylinder Ford , more leg and head room is now available and the luggage space is increased The price of the car has been advanced from £210 to £240

Hillman, Humber, and Jowett

Like others, the popular 10-h p Hillman Minx car has undergone a number of changes as regards both the chassis and the bodywork , the latter is more roomy and there is more luggage space The spring shackles are now fitted with "silentbloc" bushes which require no lubrication the four-speed gearbox is all synchromesh , other good features include self-cancelling direction indicators and long-beam dipping headlights The standard saloon sells at £169, the de luxe model at £184, and a four-seater drop-head coupé at £215 One of the features of the Show is the new 14-h p Hillman which, with a five-seated saloon body, is listed at £248 It has "evenkeel" independent front-wheel springing, and there is a large luggage space with a separate compartment for the spare wheel and tyre

The Humber Company is now confining itself to four models of six-cylinder cars, two of which, in view of the Humber reputation and the marked reduction in prices, may be mentioned The first is a Sixteen at £330 and the other a new 21-h p Snipe at £345 Both have the 'even-keel" independent front-wheel suspension gaiter-enclosed rear springs Bendix-Cowdrey compensated brakes, and easy-to-clean wheels , there is comfortable accommodation for five persons

The Jowett Company—the only firm using engines of the horizontal type—continues the production of its 8 h p two cylinder and 10 h p four-cylinder cars, the prices of which are now £169 for the 8-h p and £199 for the 10-h p , de luxe types of the two cars costing an additional £10 Various improvements in detail have been introduced and the frontal appearance made more attractive A feature of the 10 h p car is the use of the Warren synchronizer in conjunction with the four speed gearbox, a device which is claimed to facilitate gear changing and to permit free-wheeling if desired

Lanchester and Morris

The chief item of the Lanchester Company's 1938 range of cars is the new 14-h p six-cylinder Roadrider, which is claimed to embody no fewer than sixteen special points, prominent among which are independent front-wheel springing, the Daimler fluid flywheel and pre selective gearbox, adjustable steering column, and perfect ventilation without pivoting windows As a de luxe model the car is listed at £365, but with the ordinary type of clutch and a synchromesh gearbox the price is £25 lower The Eleven four-cylinder, at its reduced prices of £275 and £285, is the cheapest vehicle on the market with the special Daimler transmission

There are no more well known cars than those of the Morris Company For 1938 the number of the different types of chassis has been reduced from eight to five—namely, 8, 10, and 12 h p four-cylinder and 14 and 25 h p six-cylinder The popular Eight, apart from a few minor details and the adoption of easy-to clean wheels, remains unchanged, with saloons ranging from £128 to £149 An important feature of the larger Morris cars is the adoption of an engine with overhead instead of side valves Radiator shells are no longer chromium plated but are painted in the same colour as the bodywork, and the radiator grilles have been changed from honeycomb to metal strip pattern Other modifications include self-cancelling direction indicators and larger tyres In addition to Ten saloons at £185 and £195, there is a coupé at £220 The main attraction of the Morris range is an entirely new Twelve, which is fitted with a roomy body, a four-speed gearbox, and the other features mentioned in connexion with the Ten At present the new model is only available in saloon form at £205 for the standard and £215 for the sliding head model The Morris Fourteen at £248 10s will probably appeal to those who prefer a six-cylinder engine and a five seated body, while those who desire a powerful car will find it in the Twenty-five at £320 On this model "Jackall' hydraulic wheeljacks are included in the price, but on the 10, 12 and 14-h p such fittings cost £5 extra

Renault, Riley, and Rover

The Renault Company, one of the oldest French car firms, has a new model—an 8 3 h p four cylinder car with independent front-wheel springing, priced as a two door saloon at £155 The Renault Twelve, with its wide front seat for three persons, has only been modified in detail, the standard saloon being listed at £198, with a de luxe model at £225 and a two seated coupé at £235

A feature of the new Riley series is the introduction of a 16 h p four-cylinder model, which has a three speed synchronized gearbox with two automatic overdrives, giving five speeds in all , as a saloon the new car costs £385 Another new Riley model is the 12-h p Victor at £299

The Rover Company continues the same models as during the past season, only minor changes having been found necessary The range includes 10 and 12-h p four cylinder and 14 and 16 h p six-cylinder saloons at prices from £255 to £360, a Ten coupé at £280 recently having been added The bodywork of the Rover car, like the mechanical details, is excellent

left heart failure Current views on the aetiology of surgical cases are even more debatable Dr Bardin suggests that in addition to the other factors hitherto incriminated a reflex nervous phenomenon probably plays an important part The greater portion of the book is therefore concerned with the experimental work of Bardin and his colleagues in the investigation of this theory

The introduction of porcelain pearls into the external jugular vein of dogs showed that immediate fatal results were obtained regularly only when the size of the pearls was such that they were arrested in the interparenchymatous arterioles—that is at the level of the pulmonary nerve endings Histological investigation of survivors showed that the haemorrhagic infiltration of a pulmonary infarct was an acute exudative and haemorrhagic inflammation not a simple localized interstitial haemorrhage This suggested the cause to be a sudden disturbance of the neuro vegetative and vasomotor equilibrium of the lung Attempts to confirm these views were made by administering substances capable of attenuating or inhibiting the reflex and by cutting the vago-sympathetic trunk The results obtained in the dogs suggest that emboli usually fatal might be prevented by administering atropine ephedrine and bicarbonate of soda Preliminary clinical trials in man have been encouraging

The book is written in a clear and pleasant style and is well illustrated and well produced A bibliography of 438 references classified according to the various aspects of the subject is a valuable feature Whatever views may ultimately be formed on the work therein described and on the author's conclusions there can be no doubt that the volume represents a careful and elaborate attempt to tackle a problem of immense immediate interest to those practising clinical medicine in any of its branches

AN INTRODUCTION TO PSYCHIATRY

Modern Psychology in Practice By W Lindesay Neustatter B.Sc M.B B.S M.R.C.P With a foreword by R D Gillespie M.D F.R.C.P D.P.M (Pp 299 10s 6d) London J and A Churchill Ltd 1937

Dr Neustatter has added to the increasing number of presentations of psychiatry and psychopathology designed for the non specialist reader He begins with a sketch of the various dynamic schools and this type of psychology dominates the book In a work of this kind there is inevitably a temptation to over simplification of the problems and Dr Neustatter has not avoided this pitfall Other schools might also have been briefly mentioned A discussion of the disorders of children follows and these chapters based as they are on considerable personal experience are among the most valuable in the book Indeed one could not help regretting that this section had not been expanded As it is these chapters contain a great deal of information valuable to the practitioner concerning child guidance and different therapeutic methods play therapy etc The author obviously speaks on the basis of a considerable understanding of and sympathy for the child

the prognosis of depressive states the author adopts the stereotyped criteria whose value is open to question, and omits the factor of hereditary burdening which at least in the involutional states, is of considerable importance Again he does not make the peculiar character of schizophrenic dementia clear and the reader might be misled into supposing it similar to that of the organic psychoses

When all these criticisms have been made—and yet others are possible—one is left with the impression of a very useful book which could be much improved by a little stricter revision The author's personality and convictions emerge clearly from its pages and it is a pleasure to review a work of this kind of which this can be said There are useful chapters on inheritance on law, and one on vocational guidance by Mr Jack Jennings of the National Institute of Industrial Psychology The book may be recommended to general practitioners and social workers as a useful introduction to psychiatry

HEFFTER'S EXPERIMENTAL PHARMACOLOGY

Handbuch der Experimentellen Pharmakologie Begründet von A Heffter Vol 3 (Pp 276 27 illus RM 36) Berlin J Springer 1937

The supplementary volumes of Heffter's Handbook of Experimental Pharmacology are being produced steadily and we have now received the third of this series Their purpose is to provide a summary of work which has appeared since the publication of the first edition

The volume under review deals with the following subjects the atropine group saccharin the hormones of the posterior pituitary and of the parathyroid and the inorganic and organic compounds of arsenic and of antimony It will thus be seen that it covers a wide range Pharmacologists will welcome the appearance of an authoritative treatise on these substances more particularly because in some cases—for example atropine—it is nearly a quarter of a century since the articles in the first edition of the handbook were written The work is essentially one of reference and the authors of the monographs have covered their subjects in a thorough and competent manner In the case of the arsenicals and antimonials it is of interest to note that more space is devoted to the latter than to the former a fact which indicates the increasing importance of organic antimony compounds in the treatment of tropical diseases

Dr E Keeser in his article on arsenic deals with various important problems such as the arsenic content produced in fruits by arsenical spraying and the arsenic excretion in normal persons A short account is also given of the action of arsenic containing poison gases such as Lewisite Dr Oelkers briefly surveys the more important organic antimonials The textbook is primarily concerned with pharmacology and hence particular attention is given to such problems as the lethal doses of these compounds their distribution in the body mode of excretion etc Such matters tend to be neglected in textbooks of chemotherapy and this section therefore provides a review of information that cannot easily be found

of the earliest pathological work was done were the Royal Edinburgh Asylum and the West Riding Asylum, Wakefield and he paid a tribute to those institutions, which had gained a good name for British psychiatry The work at Claybury under Mott came into the same category The present comparative neglect of histology in mental hospital laboratories was quite unjustified Biochemical work in connexion with mental disorders was still only practised at a few laboratories of which Cardiff was an example in this country, and Munich on the Continent. Up to the present oxidation processes of nerve cells had probably claimed most attention, especially at Cardiff Another field of research awaiting much further work was bacteriology and yet another was the relationship between skin disorders and the nervous system On this last subject there was a considerable literature, relating to such conditions as eczema, urticaria, pruritus, Raynaud's disease, and alopecia areata In several skin disorders there was believed to be a so called psychical origin, and instances of cure by psychotherapy hypnosis, and suggestion were recorded He was curious to learn the experience with regard to skin disorders of those who dealt with the borderline states of psychoneurosis He imagined that the absence of skin disorders was rather a point to be noted

Need for Whole time Pathologists in Mental Hospitals

Too little skilled inquiry had been directed to the study of the internal organs as a whole, as ascertained at necropsy in mental hospitals and controlled by some records of inquiry at general hospitals Attention had been mostly concentrated on the brain This was due to the lack in mental hospitals of whole-time pathologists Such workers should be on the staff of all mental hospitals especially those serving a city and medical school With regard to disorder of liver function as estimated by the usual tests, some work had been done in Scandinavia, where liver disorders had been found in a large proportion of schizophrenics Evidence of failure of the detoxicating function of the liver would be invaluable In the deplorable absence of university psychiatric clinics with research departments in this country (save at the Maudsley)—an absence which was a reproach to British psychiatry—it was necessary to be content with such research as could be done in the public mental hospitals and registered hospitals for mental disorders The Board of Control for England and Wales had for many years published as a supplement to its annual reports accounts of research and other scientific work carried out at the institutions which it supervised But only from a very few of these places was work worthy of the name reported The conclusion to be drawn was that the institutions were inadequately equipped with men and plant and were without licence to do serious clinical or laboratory work

Dr Goodall next mentioned the need for an approved scheme of ascertaining stigmata of degeneration It was a pity that the psychotic and the defective were not adequately examined according to some definite plan, and equally a pity that the opportunity of examining their relatives was prohibited in this country The remark of one well-known psychiatrist was, "Worse than the insane are their relatives —meaning that they were the carriers of undesirable factors Another disappointing thing was the failure to find during the last forty years a safe and effective method for the cure and improvement of psychoses by the induction of fever, in such forms of insanity, for example, as acute confusion Ignorance still persisted as to the *modus operandi* of cure by intercurrent disease

He mentioned an inquiry he had some time ago addressed to mental hospitals and consultants whether in their opinion recovery could be achieved or promoted in manic-depressive states Out of fifty replies the answer was in the affirmative in forty The means mentioned were general measures known to all, also removal of septic foci and colonic lavage He wondered whether colonic lavage was really of value or whether it was an intestinal wash of the same nature as 'eyewash"? To the question whether relapses could be prevented twenty-five out of fifty replied in the affirmative, and in addition to general means, seven suggested psycho analysis or psychotherapy

Pedigree keeping

Finally Dr Goodall stressed the need for co-ordination and uniform control in areas of local authorities with the object of obtaining a comprehensive grip of the psychopathic material, chiefly for prevention In this latter sphere everything remained to be done He had advocated the appointment of a director of mental health for each local authority or combination of authorities, who would be responsible as regards information, administration, disposal, and supervision for all psychopathic cases in the area, and would be armed with authority to obtain from all concerned the necessary information for his purpose Under such an officer there should be established a department of genetics or pedigree keeping, including records of health and disease, defect, causes of death, personal and family characteristics, as well as the usual pedigree particulars, the scheme to be on a national basis, with uniform schedules Dr Goodall was strongly against leaving such schemes to voluntary effort One might as well expect people voluntarily to keep a pedigree as voluntarily to make an income tax return There was already compulsory notification of births and deaths and of various illnesses, but it would serve a larger purpose to extend such compulsion to family and personal maladies, defects, and disabilities, which at present as a whole went unrecorded and were perpetuated at will The motto should be "Discipline' rather than 'Liberty

In proposing and seconding a vote of thanks Sir ROBERT ARMSTRONG JONES and Dr A A W PETRIE respectively, paid tribute to Dr Goodall as one of the most idealistic and stimulating figures in psychiatry Dr Petrie remarked that the difficulties of pedigree-keeping had been brought home to him by a talk with a family solicitor concerning a minor member of a great family who was unstable He asked the solicitor whether there was any collateral heredity, well knowing this to be the case, but the solicitor at once said with great assurance that this was the only case of any mental disturbance in that family Obviously he felt it his duty to protect the family reputation, but if that was felt in the case of a professional servant of a famous family, what would be felt by members of families themselves, great or humble?

PARENTAL ALCOHOLISM AND ADOLESCENT CRIME

At a meeting of the Society for the Study of Inebriety, on October 12, a discussion on parental alcoholism as a factor in adolescent crime was opened by Dr H T P YOUNG Senior Medical Officer to H.M Prison, Wormwood Scrubs

Dr Young described the results of an inquiry which had been directed principally towards ascertaining the injury done to family relationships by the alcoholic habits of the parents The conclusions were based on an investigation into the causes of crime in 4,000 young offenders, between the ages of 16 and 21, carried out at Wormwood Scrubs Prison during the past seven years Of these, 2,217 provided 100 cases of alcoholic parentage, 400 cases of non-alcoholic parentage in the same series were used as a control The scheme of investigation included the physical, mental, psychological, hereditary, environmental, and delinquent aspects and was carried out by the medical staff with the assistance of a group of social workers attached to the prison who visited the boys' homes Inquiry forms sent to the parents, schools,

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY OCTOBER 23 1937

HARVEY'S METHOD AND THE FUNCTIONS OF THE STOMACH

The annual Harveian Oration is of service to medicine as well as contributing to friendship between the Fellows of the Royal College of Physicians of London The philosopher who, towards the end of a long and fruitful life, said that he still felt like a child picking up small treasures on the shore of an illimitable ocean might have added the corollary that the succession of waves, combined with the ebb and flow of the tide, turns over the shingle, disturbs the sand, and exposes new treasures or sheds new light on former discoveries So, too, the Harveian Festival gives, year by year, an occasion for survey and appraisement

Harvey directed that once every year there should be a commemoration of all the benefactors of the College together with an exhortation to the Fellows and members to search and study out the secrets of Nature by way of experiment So little of Harvey's writings remains that it is not possible to trace his own methods of investigation The immortal treatise on the motion of the heart and blood had been so worked over before it was published, the arguments so defined, the extraneous matter so eliminated, that it appears to have arrived complete, furbished and ready as Minerva from the head of Jupiter Harvey says in his introduction that he had for nine years and more confirmed his views by multiplied demonstrations, illustrated them by arguments, and freed them from the objections of the most learned and skilful anatomists At a later period of his life he was persuaded by his friend to lay before the student and lover of truth his exercises on animal generation In the introduction to this work Harvey gives his views on what might be called the philosophy of experiment, and of the manner and order of acquiring knowledge In the space of some ten pages he deals with all the essential relevant matters, which Claude Bernard some two hundred years later expounded in his introduction to the study of experimental medicine in a book of 350 pages Harvey quotes with approval Aristotle's dictum that no one can truly be entitled discreet or well-informed who does not of his own experience—that is from repeated memory, frequent perception by sense, and diligent observation—know that a thing is so in fact, and inveighs against the erroneous and almost foolish method of investigating truth commonly pursued, in which so many inquire what others have said, and omit to ask whether the things themselves be actually so or not.

This year's Harveian Orator, Sir Arthur Hurst, who himself has made many valuable contributions to the knowledge of the processes of digestion and the physiology of the stomach, describes how the Harveian methods of combined observation and experiment have led to our present knowledge of the functions of the stomach In the direct tradition of William Harvey, the American military surgeon William Beaumont made observations on a patient with a traumatic gastric fistula, recording the action of the gastric juice on various foods both in the body and *in vitro*, and the appearances of the mucous membrane during the process of digestion in sickness and in health Though portions of the gastric lining had been visualized through a rigid gastroscopic tube, its use was somewhat in the nature of a surgical operation until the recent invention of the flexible gastroscope has placed in the hands of physicians a procedure which can be carried out with comparative ease Ludwig said that the true advancer of knowledge was the inventor of a new technique The adaptation of *x* ray combined with a radio-opaque substance such as bismuth or barium to the definition of the contour of the stomach and the shape of the folds of its lining mucosa has brought about far-reaching advances in diagnosis, enabling shrewd surmises to be made of the state of the digestive organs deep-seated in the abdomen, otherwise inaccessible to observation In the last fifty years, too, much knowledge has been acquired by the application of chemical methods to the gastric contents, voided by vomiting or recovered after a test meal And the Harveian Orator pays tribute to the notable advances obtained by direct observation at operation by Fellows of the sister College of Surgeons

Sir Arthur Hurst points out the importance of the stomach for the rest of the body The acid of the gastric juice acts as an antiseptic on the bacteria swallowed with food and saliva, protecting the lower digestive tract from invasion by harmful organisms The digestive juice contains not only pepsin a ferment so useful in beginning the digestion of proteins preparing them for further digestion and assimilation, but also bodies essential for stimulating the bone marrow to the production of red blood corpuscles and a substance required for the normal nutrition of the nervous system Much interest and value attaches therefore to the revived conception of gastritis as a common occurrence Inflammatory, degenerative, and atrophic processes

advantages in getting the preliminary training out of the way before the girl entered hospital

The nurse received her training by an apprenticeship during which she performed actual nursing duties and received theoretical instruction In the majority of training schools this theoretical instruction was given along with the ward work, partly in 'on duty and partly in 'off-duty" times He thought that the extension of what was known as the 'block" system might be considered, in which the theoretical work was done in three periods of from three to four weeks, divided by periods of ward work with little or no theoretical instruction Concerning the nature and extent of the theoretical instruction, Mr Roberts said the syllabus of the General Nursing Council was admirable, but there was a tendency in the actual questions set to demand a knowledge of purely medical subjects He concurred in the recommendation of the *Lancet* Commission that the questions should be confined to nursing treatment, and should not bring in systematic medicine, surgery, gynaecology or psychiatry On the other hand, the provision of special post-certificate courses in both technical and administrative subjects leading to the acquirement of diplomas or higher degrees offered scope for the ambitious and capable nurse to distinguish herself from the 'general practitioners of nursing Several American universities and the University of British Columbia had established schools of nursing with a five-years course leading to a degree It was improbable that such courses would be started in this country, as they must tend to produce women who would not be satisfied with performing only the duties required of the vast bulk of nurses The nursing diploma of the University of London was on quite a different footing

Discipline and Conditions of Service

When the hospital nurse in the modern sense of the word first appeared it was so unusual for educated girls to leave their sheltered homes except to marry or to enter another family as governess that strict, almost monastic, rules had to be made to govern their conduct in hospital No organized work, obviously, could be carried on without rules and regulations Nurses and probationers loyally accepted the discipline during hours of duty It was a different story in the off-duty hours Educated women, even when probationers, resented being treated like irresponsible children In many hospitals the rules had been relaxed, but the whole atmosphere of tutelage remained such that numbers of girls accustomed to be trusted refused to contemplate a nursing career Even to day in the majority of hospitals a nurse, having finished her day's work and having nothing to do until bedtime, could not go out to buy a stamp or post a letter without asking permission It was odd that a nurse given duties in the ward which implied a great responsibility, should be considered irresponsible the moment her duty was over The private life of a nurse when not on duty was no more the concern of the hospital than was that of the doctor's secretary to the doctor

In many hospitals the actual hours of duty had been reduced to forty-eight, with benefit to the nurses health and standard of work Nurses seemed to be opposed to the three shift system, though it was attractive and would simplify many problems In some hospitals the off duty times were not known in advance or were altered at short notice, and even the date of the annual holiday was not known long enough beforehand for adequate arrangements to be made These things were of importance to the nurse and the knowledge that such conditions existed was another deterrent

The rates of pay were probably somewhat lower than they should be but when the value of the emoluments was added to the cash salary they did not appear so unfavourable compared with those in other occupations More important than preser pay was provision for old age and retirement Superannuation schemes were in existence, but interchange between voluntary and municipal hospitals was a difficulty It was very important that the nurse should be able to feel secure for her old age and that pension rights should follow her in her changing employment With regard to the proposed provision of assistant nurses or "nursing assistants" (although these terms were not liked), the British Medical Association had recently, at the request of the College of Nursing, considered the question and had given its blessing to such a grade It was suggested that the assistant nurse should be given a practical training of two years, mainly in wards for the chronic sick, and should not be made to pass examinations or formally enrol, but be given what amounted to testimonial letters

On the subject of nurses uniform, Mr Roberts pointed out that this was a survival from the time when nursing was carried out by professional nuns, and it still suggested a vocation as distinct from a profession It was an anachronism, like the copes and chasubles of ecclesiastics and, like them again, unsuited to modern life It was expensive in washing and in time (he heard of one nurse whose costume required the adjustment of eighteen buttons, six hooks, and five studs) and, moreover, it was insanitary A nurse should, on arriving in the ward, put on a clean overall, fastening at the back, with a low collar, and this should be removed before leaving the ward Surely it did not pass the wit of woman to devise a garment to satisfy her aesthetically In this country it was common for such a costume to be worn by a masseuse, and in other countries it was almost universal

Concluding, Mr Roberts said that the Minister of Health had announced the setting up of a Commission to review the present difficulty in providing trained nurses in numbers adequate for the needs of the community He hoped that the recommendations of the Commission, together with the evidence on which they were based, would receive the widest publicity, because, apart from economic reasons it was only by the pressure of informed public opinion that action would result

---

THE TOBACCO PROBLEM

At a meeting of the Southampton Medical Society on October 6, with the president, Dr J H PENDERED in the chair, Dr J D ROLLESTON read a paper on the tobacco problem

Dr Rolleston maintained that the subject of tobacco smoking was quite as much a concern of public health as that of the acute exanthemata, diphtheria, and other forms of acute infectious disease—a view which appeared to be gaining ground in Germany, where many doctors and scientific men concerned with the supervision of the health of the German people were of the opinion that the danger due to nicotine was as great as that caused by alcohol The study of the tobacco problem was taboo at scientific meetings other than those of the Society for the Study of Inebriety and Drug Addiction, the existence of which seemed to be unknown to a large proportion of the medical profession Although the subject had received little attention in this country, an increasing amount of literature on smoking had recently been appearing not only in Germany but also in the United States and in France, but with the exception of a paper by W A Bastedo of New York, who adopted a somewhat indulgent attitude, no word had been said in favour of tobacco

After a brief historical survey the speaker quoted statistics of the incidence of smoking in different countries and amongst different religious denominations He was inclined to regard the tobacco habit as an addiction, though not of the overpowering nature of addiction to morphine, heroin, or cocaine He quoted Dr E W Adams's definition of addiction as a state of bondage to a masterful drug, manifested by craving tolerance, intense discomfort of a specialized character on withdrawal

by Lord Ponsonby to legalize voluntary euthanasia was rejected after speeches by Viscount Dawson and Lord Horder Debates on the estimates brought in many medical matters On the Ministry of Health estimates the House of Commons debated maternal mortality and the ophthalmic benefit regulations, on the Colonial estimates, medical research in Kenya and health on the Gold Coast, on the Civil estimates, malnutrition, and on the estimates for the Scottish Department of Health, the Highlands and Islands Medical Service A ministerial statement on the school medical service when the Education estimates were introduced announced the aim of the Department to be the annual medical inspection of all school children

The health of the adolescent besides being one purpose of the Physical Training and Recreation Act, was a chief consideration during the debates on the Factories Act Modifications were sought in the provisions concerning hours of employment of young persons Safety precautions were strengthened, and there was discussion on the duties of examining surgeons, during which Sir Francis Fremantle spoke on the need for training more medical men in industrial medicine The Maternity Services (Scotland) Act was also keenly debated Its main principle that medical attendance should be available for all women at childbirth was an advance on the provisions of the Midwives Act in England Scottish members approved the Bill, but the Opposition attempted, without success, to restrict practice under the Act to panels of practitioners "specially qualified in midwifery" and to reduce the attendances of medical students at confinements

Two Bills having support in some medical circles were unsuccessful The Medical Practitioners' Communications (Privilege) Bill was brought forward by Sir Ernest Graham Little but was rejected by the House after the Solicitor-General had declared that the passage of the Bill in the form in which it was introduced would impede the administration of justice Recommendations for a wider and simplified duty on proprietary medicines and on cosmetics were made to Mr Neville Chamberlain, then Chancellor of the Exchequer, but he did not adopt them for this year's Budget On the Local Government Superannuation Bill Sir Francis Fremantle and Captain G S Elliston were vigilant for the interests of medical officers and midwives Equal care was taken in the similar Bill for Scotland Lord Addison spoke in the House of Lords on medical aspects of the Agriculture Act and during the discussion in the Commons on the Government's amendments to the Milk Marketing Scheme a criticism of pasteurization was countered by allusions to the milk-borne epidemic at Bournemouth last year During the session Mr Lloyd for the Home Office made a statement on the admission of alien doctors and dentists to practice in the United Kingdom and the recent restrictions on such admissions Sir Kingsley Wood announced that co-operation between voluntary and public hospitals in England and Wales was increasing steadily He added that he had no power to secure the regional pooling of the funds of voluntary hospitals

The members of the Parliamentary Medical Committee have spoken effectively on medical subjects both on the floor of the House of Commons and in Standing Committee, but more medical speakers would be valued on the Opposition side of the House now that health has become a standard topic

NUTRITION IN INFANCY AND CHILDHOOD

The recommendations of a group of experts[1] representing eleven countries and appointed by the Health Organization of the League of Nations to consider the assessment of the nutritional state of children have just been published In the same bulletin appear the recommendations of another group of specialists[2] on the nutritive requirements of the normal child in the first year of life The second of these reports will probably gain rapid and general approval in its main outlines It contains nothing startling and is if anything rather conservative It is suggested that two questions needing further investigation are the advisability of administering medicinal iron to all children between the ages of 4 months and 1 year and an examination of the differences between irradiated milk and artificial preparations of irradiated sterols The first of the two reports deals with more controversial and difficult issues The assessment of the nutritional state of a child is admittedly very difficult It may be taken as accepted in this country by all who have studied the problem that undernutrition does exist among the least privileged classes of the community and that this state of deprivation can be remedied from the resources of foodstuffs at our disposal The extent of undernutrition is however a subject on which there is no agreement Professor Bigwood of Belgium quotes examples of the discrepancies between the conclusions arrived at by different means in our own country Whereas an assessment of the state of nutrition of children by summary clinical examination has led to the conclusion that it is satisfactory in 75 per cent Sir John Orr has concluded from his studies of English dietaries that these are not satisfactory from the point of view of nutrition in more than 50 per cent of the population This raises at once the difficulty of detecting states of subnutrition by clinical examination In most of the methods of assessment in use including measurements of height and weight and the more complicated indices of limb and girth measurements there is no objective criterion of

[1] *Bull Hlth Org L o N* 1937, 6, 129
[2] Ibid 6 291

that there would always be change Medical men were optimistic and were always trying out new treatments, and patients were demanding that they should Operative surgery was reaching the end of a period—namely, the period of the easy exploitation of surgery made possible by Lister's work He felt that the future lay mainly with the chemists and the electrophysicists and that the new methods were most likely to evolve in those directions Mr Guy Drew, in responding ventured one daring prophecy, that on a similar occasion in a hundred years time a man might turn to his neighbour and ask, "What was steel?" Dr G N Gardner proposed the health of "The Guests," who on the medical side included Dr G C Anderson, secretary of the British Medical Association, Mr F F Rundle, Dr Mitchell Heggs, and Mr A Simpson-Smith, the last-named replying in a happy speech, in which he complimented the surgical instrument makers on their artist eye and creative hand It was customary, Mr Simpson-Smith said, to go to Germany to see German surgeons operate, and to France to see French surgeons, but visitors who came to this country did so not only to see British surgeons operate but to see British surgical instruments

Medical Benevolent Society for the East and North Ridings

It is difficult to understand the smallness of the membership of the society which serves the East and North Ridings of Yorkshire (including the city of York) In his report to the recent annual meeting Dr C H. Jackman, the honorary secretary, expressed his disappointment at the total membership, which was 124, the same figure as for the previous year, three resignations and two deaths having been balanced by the election of five new members He appeals for more members, and points out that by joining the society practitioners not only ensure that help will be forthcoming should the time unfortunately come when those they leave behind are without adequate support, but they also assist in the general good work of the society It was agreed at the annual meeting to renew last year s grant of £50 to a doctor's widow Full particulars of membership of the society can be obtained from the honorary secretary, Dr C H Jackman, 95, East Parade, Heworth, York

Central Midwives Board

At the October meeting of the Central Midwives Board for England and Wales, appointment as examiner was granted to Mr John Barnard Blaikley, F R C S A letter was read from the medical officer of health for the city of Stoke-on-Trent regarding the practice of midwives in his area of notifying births to a particular insurance society and receiving payment for such notification The Board replied that although the rules did not specifically forbid midwives to notify births to an insurance society, it was of the opinion that they should aim at a standard of conduct which increased rather than diminished the dignity of their profession, and that from this point of view the practice of midwives notifying births to an insurance society was to be deprecated Applications from six institutions in the Provinces for approval to provide instruction in the essentials of obstetric analgesia and in the use of a recognized apparatus were granted A report from the secretary regarding the regulations for the midwife-teachers' examination was considered, and it was resolved that the existing regulations, which the Board decided should apply to the examinations to be held in 1936 to 1938 inclusive, should be continued for the year 1939 A letter was considered from the medical officer of health for Hastings inquiring whether it was in order for a midwife recently appointed as municipal midwife to Hastings to use the words Municipal Midwife ' or the brass plate outside her door in addition to S C M ' The Board replied that it saw no objection.

FRANCE

[From Our Correspondent in Paris]

Organization of International Conferences

The young lady who was asked if she played the piano, and who replied that she did not know as she had not tried, betrayed a mentality which seems to have been common to many organizers of international conferences in Paris this summer The spirit has been willing but in many cases experience and the necessary gift for organization have proved weak, very weak Professor Gosset, who has most ably piloted several of these conferences through difficult waters, has been quite candid in his expressions with regard to the need for more expert organization in this field One of his suggestions deserves special note , it is that if all the organizers of international medical conferences would pool their plans well in advance, an important step would be taken to prevent that overlapping which has caused much annoyance this summer One form of overlapping concerns those eminent leaders of the profession who have not the heart to refuse invitations to speak and preside at conferences, and whose generous response in this respect forces them at the last moment to make an invidious choice between two or more meetings timed for the same hour in different places

Professorship in Medico social Medicine

The Paris Faculty of Medicine has created a new chair of "Assistance Médico sociale," to which Dr Crouzon has been appointed He has already had a distinguished career, and is a physician of the Salpétrière Hospital and a member of the Academy of Medicine Well known in the field of neurology, he is the author of several works on familial diseases, and occupational diseases and accidents He has also founded a school of nursing and is the secretary-general of the Neurological Society The subject with which the occupant of this new chair must deal is at once so novel and so vast that Professor Crouzon assuredly has his work cut out for him

The New Rector of the University of Paris

The appointment of Professor Gustave Roussy, Doyen of the Faculty of Medicine, as Rector of the University of Paris, in succession to M Charléty, is very popular, particularly in medical circles It is the first time that this honour has been conferred on a member of the medical profession He was born in Switzerland of French stock, his family having emigrated from France at the time of the revocation of the Edict of Nantes He began his medical studies in Geneva and continued them in Paris, where he became a hospital intern in 1901 As early as 1910 he became a professor by virtue of his contributions to pathological anatomy, and it was to the chair in this subject that he succeeded when it was vacated by Professor Letulle During the great war he was at the head of a neurological service in the French Army, and he has for many years been in charge of the large cancer research institute and hospital at Villejuif in the neighbourhood of Paris His brilliant administrative gifts should serve him well in his new post

Early Diagnosis of Cancer of the Stomach

The second International Congress of Gastro Enterology, which was held in September, served a most useful purpose in bringing together experts in this field from as many as thirty-five different countries Professor Pierre Duval presided, and the Minister of Public Health, M Marc Rucart, was among the distinguished personages present The two subjects for discussion on the programme were the early diagnosis of cancer of the stomach, and acute

These facts show clearly that the supply of an anti-malarial remedy at the lowest possible cost is one of the most urgent needs of India, and the figures already quoted prove that the present consumption of quinine in that country is wholly inadequate Sir Henry Gidney shows that the Indian Government has treated the production of quinine as a business venture, and has been concerned chiefly in making a reasonable profit. He calculates that it makes an annual profit of 7 2 lakhs of rupees on the sale of 90 000 lb of quinine Business principles applied to the supply of drugs essential for the health of a population lead however to somewhat absurd balance-sheets, since Chopra calculated that the loss to India directly from malaria was over rather than under £20 000 000 annually The ratio between the profits on quinine and the loss due to malaria works out at about 1 to 500 Sir Henry Gidney indicates that the real reason for the deficient supply of quinine in India is a trade agreement with Java The quinine bureau is, of course a business concern chiefly interested in maintaining the price of quinine at a figure which will yield a good profit. From the economic point of view this bureau has achieved a remarkable success since quinine is one of the few natural products whose price has been relatively constant since the war in fact, its price to-day is the same as it was in 1921 Sir Henry Gidney points out that this policy of maintaining the price of quinine has been disastrous to the health of India and concludes his address as follows

"I want the Government to inform this Board why has it been for all these years, unwilling—I use the word advisedly and with great discretion—to terminate this terrible agreement that it still has with Java in our quinine supply? Why has this Government been unwilling to serve the interests of India? Why has it been unwilling to take away India from the list of backward nations of the world? Why has it been a party to depriving India of its own quinine cultivation, knowing all the while that Java is depriving India of crores of rupees by prohibiting India from cultivating its own quinine for a disease that is killing millions of Indians every year, a disease that is sapping our very life and, in being an economic menace, is destroying the nation?

WELFARE OF THE BLIND

The twelfth report of the Advisory Committee on the Welfare of the Blind[1] covers the three years ending June 1937 The most noteworthy record is the register of the blind The tabular statements show that during the years 1932 to 1936 there was an increase in the number of registered blind persons in the older age groups only The decrease over a period of years in the figures relating to children and adolescents has been steadily progressive and confirms the value of the measures taken for the prevention of infantile blindness and the preservation of the sight of school children There has been a further decrease since 1932 in the age group 5–16 of 0 26 per 1 000 The decrease in blindness in children may be due to a variety of causes but undoubtedly the ophthalmia neonatorum regulations have been to a large extent instrumental in reducing the number of cases due to this disease A continuation of this decrease will materially affect some problems of the education training and placement of young blind persons Attention has been drawn to the fact that the increase in the total number of registered blind persons is to be ascribed rather to more complete registration than to an increased incidence of blindness It is however a matter of considerable importance that so many people of this country in middle and old age are found to be "so blind as to be unable to perform any work for which eyesight is essential" Research into the causes of blindness occurring in the later years of life may produce valuable information and the work of the specialist subcommittee it is hoped may bring practical assistance in the prevention of blindness The report emphasizes the importance of just and correct certification of blindness and the need for utilizing for that purpose the services of medical practitioners with special experience in ophthalmology Attention is drawn to the findings of the Prevention of Blindness Committee that the visual acuity of persons on the borderline of blindness may vary to some significant extent with the degree and standard of illumination of the test cards The committee recommended a standard form of illumination Pensions for the blind now amount to £558,000 per annum 84 7 per cent of those registered were receiving the pension There is an important report on the methods of augmenting the earnings of the blind in workshops A leading recommendation is that competent workers should fill these workshops and that they should not be used as occupational centres It follows that a certain standard of efficiency should be attained by each entrant before admission A separate report[2] on the home teaching of the blind has also been issued The duties of these home teachers are many the discovery of blind persons and their needs regular visiting teaching Braille or Moon types and pastime occupations oversight of the hygiene, welfare work and social needs of the blind with special care of the deaf blind Such work needs special qualifications Further there is evidence that in many areas the home teachers are not able to reach some of the blind people on their registers for periods of many weeks or even months and that where they pay visits at fairly short intervals they are compelled to make those visits so brief as to render any efforts at teaching wholly ineffective Recommendations are made to remedy these defects

CO-ORDINATION OF VOLUNTARY HOSPITALS

The British Hospitals Association (12 Grosvenor Crescent, S W 1) has set up a provisional central council to consider and advise how the following three recommendations of the Voluntary Hospitals Commission can be best implemented (1) The division of the country into hospital regions (2) the formation in each region of

[1] Twelfth Report of the Advisory Committee on the Welfare of the Blind to the Minister of Health 1934–7 H.M Stationery Office 1937 (6d)

[2] Report of the Subcommittee on Home Teaching, Advisory Committee on the Welfare of the Blind H M Stationery Office 1937 (3d)

retraction proximally was reduced to a minimum, and reinsertion of the torn end to the base of the distal phalanx took place I notice in the present article that in all three cases there was failure to secure *complete* extension The authors used full extension of the whole finger in fixing the joints after suturing the cut tendon (Compare article by Mr Smithe in the *Brit J Surg* for January, 1937)

There is no doubt that free tendon transplants with their intact paratenon are not used as frequently in this country as in America, where the practice is to remove the cut tendon, substituting a length from a redundant tendon like the palmaris longus, instead of forcing together and suturing the macerated ends and ignoring tendon sheaths Anyone interested in this work could not do better than study the excellent illustrated article by Mr Bunnell in the *J Bone Jt Surg* for January, 1928—I am, etc,

London W 1, Oct. 17 G O Tippett

Endotracheal Anaesthesia

Sir,—The statistics given by Dr Langton Hewer and Mr Geoffrey Keynes, admirable as they are, seem questionable evidence in support of their argument that endotracheal methods are undesirable in operations for toxic goitre One series of cases quoted was given endotracheal ether, the other, avertin followed by nitrous oxide oxygen That the better results of the second series were due to the non-use of tracheal tubes seems an unwarranted deduction

I would suggest that endotracheal methods have become less used in thyroid surgery since the introduction of avertin not because their use was considered a "needless hazard" nor because the need for perfect aeration was less than formerly, but because under the light anaesthesia provided by avertin and nitrous oxide with oxygen a tracheal tube was no longer a guarantee of smooth unobstructed respiration Mobilization of the gland or other surgical manœuvres which caused relative movement of the tube and the trachea were apt to cause a spasm of coughing In the absence of a tube the same surgical procedures might cause asphyxial symptoms through a laryngeal spasm Anaesthetists tended to prefer the latter risk, though Dr Hewer himself has stressed elsewhere the difficulty of detecting minor degrees of cyanosis and the importance of avoiding them in these cases Actually, in non-obstructive toxic goitres one can avoid both complications by passing a tube only just through the cords On the one hand this provides the perfect airway desired, and on the other no surgical manœuvre upsets the rhythm of respiration, and as the tube does not even touch the walls of the trachea it can hardly cause a tracheitis—I am, etc,

Manchester, Oct 11 H. J Brennan

Sir,—I am in entire agreement with Dr Langton Hewer and Mr Geoffrey Keynes as to the unsuitability of endotracheal anaesthesia for non-obstructive thyroidectomy, and I should like to bring forward some statistics in support of those which they gave In a series of over 1,100 endotracheal anaesthetics for all operations the post-operative incidence of laryngitis and tracheitis was found to be 1.2 per cent On further analysis of this series it was found that after operations for non-obstructive goitre the incidence of laryngitis and tracheitis was 8 1 per cent, which clearly demonstrates the effect of surgical handling of the trachea when a tube lies within it—I am, etc,

London, N W.3, Oct 10 C J Massey Dawkins

Spinal Anaesthesia for Caesarean Section

Sir,—I was interested in the comments of Dr Herbert R Spencer (*Journal*, October 9, p 723) on the subject of spinal anaesthesia for Caesarean section In the obstetric unit of the Royal Free Hospital we have used spinal anaesthesia for a number of these cases for several years, this method being used in preference to any other, except in such cases as Dr H. K Ashworth (October 2, p 671) mentions as being unsuitable The results may be of some interest Of 120 Caesarean sections performed during the years 1935 to 1937 forty-four were done under spinal anaesthesia with no maternal deaths There were no cases of paralysis or meningitis in the series, and the incidence of any degree of headache was not marked

The anaesthetic solution used does not belong to the cocaine group A 1 in 2,000 solution of light percaine was used with a preliminary injection of ephedrine to combat the fall of blood pressure The excellent contractions of the uterus seen under spinal anaesthesia lead to a greatly diminished loss of blood, and the baby is entirely unaffected by the anaesthetic I am in full agreement with Dr Ashworth that when there are no contra indications, such as low blood pressure, severe myocardial deficiencies, profound anaemia, or severe cardiovascular disease, Caesarean section is an excellent indication for this type of anaesthesia—I am, etc,

London, W C 1, Oct 12. Katharine Lloyd Williams

Sir,—I was interested, but rather surprised, to read the letter from Dr Herbert Spencer in the *Journal* of October 9 (p 723), as I had not realized that spinal anaesthesia was supposed to be contraindicated in Caesarean section When I was on the staff of the large C M S hospital in Old Cairo (1915–27) we used spinal anaesthesia for practically all operations below the level of the diaphragm, and we were doing over 2,400 operations a year by this method I have no statistics here, but I remember I used regularly to do many Caesarean sections under stovaine spinal anaesthesia, and never saw any ill effects in either mother or child—I am, etc,

Bromley, Kent Oct. 12 Robert B Coleman

Indications for Induction of Abortion

Sir,—Like many a sound thesis before it, mine seems likely to disappear in the barren sands of irrelevant discussion in your columns Let me make a last attempt to save it

Mr Butterworth (*Journal* October 16, p 775) cherishes the not uncommon notion that one may alter facts by using different words about them, preferably words of ambiguous meaning He sends two patients to the gynaecological department of a hospital in order that they may have abortion induced In the legitimate exercise of their discretion the colleagues to whom he refers them decline to do as he asks on the grounds that they do not find adequate clinical indications for this procedure But to the traditional and appropriate word "clinical" Mr Butterworth objects, preferring the word "departmental" and thinking—as we must suppose—that the verbal substitution alters the facts Yet if this word has not the connotation of "clinical" in the connexion in which he employs it, then it has no meaning

Unwilling to allow the colleagues for whose assistance he has asked the freedom of judgement he claims for himself, he presumes to rebuke them in your columns for not doing what, in the particular circumstances, would not be for them a legal operation He boldly stigmatizes

ANAESTHESIA IN GENERAL PRACTICE

This is one of a series of articles, contributed by invitation

RISKS OF ANAESTHESIA—I

BY

M D NOSWORTHY, M D, B Ch., D A,

Honorary Anaesthetist to Westminster and St Thomas's Hospitals

Difficulties of one sort or another are to be expected with certain types of patient or operative procedure If the anaesthetist is on the lookout for them he should by intelligent anticipation be able to prevent their occurrence, or else by a suitable anaesthetic technique counteract their effects During anaesthesia many situations arise which will develop into emergencies unless the anaesthetist recognizes the early signs of trouble and immediately takes the necessary steps to regain control. Sometimes an accident occurs with no warning at all, and a successful outcome may well depend on the right thing being done promptly and without hesitation. The difficulties encountered during anaesthesia, though small in number, crop up again and again in slightly different forms Only the chief risks can be outlined here with the general principles of treatment, these principles, however, can be modified to apply to other emergencies which have in fact originated from similar faults

Oxygen Want

The respiratory and circulatory systems are closely linked together so that oxygen want in the tissues (anoxia) arising from failure or partial failure of one system will quickly embarrass the other Anoxia being the underlying factor in so many anaesthetic troubles it will be well to emphasize some of its physical signs These are (1) increase or decrease in the rate of the pulse, which is slow, bounding, and often irregular in acute oxygen want, (2) rise or fall in systolic blood pressure, (3) altered breathing—depressed quick, and shallow, or periodic respirations, or yawning (4) nausea and vomiting, (5) muscular twitchings, (6) restlessness, (7) cyanosis Cyanosis always indicates suboxygenation, but a high proportion of patients suffering from oxygen want show no cyanosis

Anoxia is responsible for many of the troubles encountered during spinal anaesthesia, and is not infrequently present during or after general anaesthesia Pyrexia, fear, pain, and hyperthyroidism all increase the patient's oxygen requirements

Abuse of Carbon Dioxide

Nowadays carbon dioxide is commonly regarded as the 'cure' for practically all anaesthetic difficulties Actually its injudicious use has cost many patients their lives It should be remembered that morphine and the basal hypnotics depress the breathing by decreasing the sensitivity of the respiratory centre to carbon dioxide, with the result that the alveolar content of carbon dioxide banks up to a higher level than usual The patient's physiological processes are deranged by this excess and will consequently not benefit from any addition to this burden For the majority of patients who happen to be in this depressed state the lesser of two evils is probably the use of sufficient carbon dioxide or rebreathing during induction to secure normal pulmonary ventilation Creating a higher concentration of carbon dioxide, with the objects of producing an exaggerated hyperpnoea and rapidly inducing anaesthesia with intolerable concentrations of ether, or any piling up of carbon dioxide in an acidotic patient, is not to his advantage Individual susceptibility to carbon dioxide is very variable, and if the normal immediate response to a low concentration—namely, an increased depth of respiration and a rise in blood pressure—does not appear overdose for that particular patient is a probable contingency, and the use of carbon dioxide must be immediately discontinued

The signs of toxicity due to carbon dioxide are a fall in blood pressure, depressed or gasping breathing, and muscular twitchings, which may pass on to generalized convulsions and death Waters and his associates, who are responsible for most of the experimental work on carbon dioxide, have shown that the improvement in cases of circulatory depression and shock commonly attributed to carbon dioxide oxygen mixtures is in fact due to the good effects of the high oxygen concentration outweighing the ill effects of the carbon dioxide The continued inhalation of a concentration of carbon dioxide above 10 per cent will produce unconsciousness in normal unanaesthetized subjects In this connexion it is of significance that asphyxiated patients and newborn babies recover more certainly and more quickly when pulmonary ventilation is carried out with 100 per cent oxygen

For success with the carbon dioxide absorption technique efficiency of the absorbent material and of the canister design and reduction of the dead space to the minimum are essential Towards the close of the operation the contents of the rebreathing bag must be repeatedly changed in order to wean the patient slowly from the warm, moist—and possibly high oxygen-containing—atmosphere which he has been breathing and to restore him to normal atmospheric conditions

It has been shown that carbon dioxide, oxygen, and all anaesthetic gases are rapidly and completely absorbed from the pulmonary alveoli After operation the patient should be encouraged to take deep breaths If he cannot or will not comply a gentle flow of pure carbon dioxide—a watch being kept for any signs of toxicity—may be blown *at* his face This will make him fill his lungs with air, the presence of the *unabsorbed* nitrogen decreasing the risk of pulmonary collapse The use of carbon-dioxide-oxygen mixtures, in contrast to this, may be followed by patchy areas of atelectasis or even complete collapse of lung

Oxygen want and carbon dioxide overdosage singly or combined, are liable to crop up on many occasions during anaesthesia and are the underlying factors in many anaesthetic states which are difficult to explain on any other basis—at least I myself can call to mind situations which at the time I never attributed to carbon dioxide overdose but in which I am now convinced excess carbon dioxide played an important part

Overdose of Sedative Drugs

Among the effects of overdosage with sedatives are those of low alveolar oxygen and high alveolar carbon-dioxide concentrations If it relieves the anoxia resulting from the low blood pressure and the depressed breathing an atmosphere enriched with oxygen will improve the respirations The administration of carbon dioxide and oxygen may break the vicious circle, but on the other hand this additional carbon dioxide may be beyond the patient's tolerance and still further depress the breathing and the blood pressure Artificial respiration with a high

Epidemic Catarrhal Jaundice in School Children

SIR,—It was interesting to read the account in the *Journal* of October 9 (p 703) by Dr B Sergeant of the epidemic in Gateshead In the part of Surrey where I live, though we have had no epidemic for some years, there are two village schools where there are nearly always one or two families affected Unlike Dr Sergeant, we find it usual for more than one member of the family to be affected, and it is the rule of the local education authority, the Surrey County Council, to exclude home contacts for three weeks, it would appear that this period is too short, but in practice there seems to be little tendency for further cases to occur in the school

Local feeling would blame the grey squirrels for the infections, but this may be merely "little England" bias This spring, in one of the villages, a boy aged 12, who attended a central school four miles away, developed jaundice, a sister (8) and a brother (6) caught it after intervals of four and three weeks respectively, a baby of 7 months and the parents were not affected There was no history of contact in or out of school with another case, but a Great Dane, a frequent companion of the children, had been treated for jaundice three or four weeks before the elder boy became ill

If there is to be any advance in our knowledge of this disease it will be from the observations of general practitioners and school medical officers, as only very rarely do these patients enter a hospital, they usually are treated at home, recovering after one visit from the family doctor, or even without it—I am, etc,

Chaldon, Surrey, Oct 10 G D PIRRIE

Coronary Thrombosis

SIR—I must have cut up a mile of coronary artery in my time, but only occasionally have I come across true thrombi I was therefore just as puzzled as the coroner who asked me, "What is this coronary thrombosis of which everyone is dying nowadays?', until I heard the solution of the riddle in a county court the other day No less than three medical men—out of the four of us—went into the box and said that in coronary thrombosis there need not be any thrombus! I was not given the opportunity of saying that, for some of us at least, the word thrombosis means exactly what it says, nor was it at all amusing to have to sit and listen to the court making merry at the expense of the profession

The old-fashioned clinical diagnosis of angina pectoris was quite unobjectionable Would it not be better if the terms coronary atheroma, coronary stenosis, coronaritis, and coronary thrombosis were reserved for cases in which a pathological examination has been made?—I am, etc,

London, W 1, Oct 14 TEMPLE GREY

Idiosyncrasy to Prontosil

SIR—Dr H W Barber (October 16, p 774) records interesting cases in which prontosil caused marked rise of temperature, and subsequent improvement occurred in the condition of the patients I would suggest that the prontosil caused the fever by killing large numbers of the bacteria with which the patients were infected It is, I think, acknowledged that a heavy dose of dead bacteria may produce fever, and its occurrence may well be an indication that a drug producing fever in such cases, but not in ordinary healthy persons, is really proving its efficacy I think that in such cases the drug should be continued with due care and precaution It is quite likely that it would cease to cause fever as the bacteria are eliminated—I am, etc,

Lingfield Oct 18 HUGH WOODS

Sulphanilamide in Gonococcal Infections

SIR—In reply to Dr R C Webster (October 9, p 727) I have pleasure in answering his questions concerning the statements contained in my recent letter

In my opinion a cure of gonorrhoea can only be assessed by a careful, repeated microscopical and cultural examination of the secretions of the urethra, prostate, seminal vesicles, and urine At least three negatives should be required before declaring a case cured The secretions should be absolutely free from bacteria and pus cells The practice of passing a case as cured when a smear contains three or four pus cells per field only is to be deprecated, as most of these cases are likely to recur, even years after an attack A test should be made two weeks after cessation of all treatment and, if negative, again at intervals of a month, three months, six months, and one year The test should be preceded by massage of the urethra, prostate, and seminal vesicles over a metal bougie

Dr Webster considers that gonorrhoeal infection of the bladder is uncommon, but it is my experience that trigonitis is invariably present in acute posterior urethritis It is for this reason that I massage anterior urethral instillations into the posterior urethra and bladder The procedure is not difficult when the knack has been acquired of making the internal sphincter relax at will To see is to understand Gonococcal pyelitis is not so infrequent as is commonly supposed It is more liable to occur where there has been a previous pyogenic infection of the kidney I have seen several cases, and reported one at the Royal Society of Medicine last year Frequent bladder irrigations precipitate the ascent of the infection Chiefly for this reason I have dispensed with bladder irrigations

I am treating an acute case at the moment by my method, combined with injections and oral administration of prontosil. The case was seen on the first day of discharge September 29, and was thought to be cured by all tests on October 4—six days Slides were negative for four days in succession, and all symptoms had ceased No treatment was given for four days, and to-day a very slight discharge was massaged from the urethra, which was teeming with pus cells and gonococci This case is indicative of the fallacy of relying upon prontosil as a curative measure as soon as all signs of disease have disappeared

—I am, etc,

London, W 1 Oct 12 MORTON WHITBY

The Sex Ratio

SIR,—Though conscious that the subject is full of pitfalls and that senior wranglers quail before its calculations, I should like to add a few observations to Surgeon Rear-Admiral Beadnell's letter in the *Journal* of October 2 (p 683) Both he and Professor Crew, in his 'Wisdom of Being Female" speech, seem to take it for granted that early death disposes of the excess males born in this country But does it? Births are registered, so the sex ratio at birth—about 105 males to 100 females—should be practically correct, and this means an annual excess of several thousand boy babies What does happen to them? Comparatively few die in infancy nowadays

PUERPERAL INFECTIONS IN RELATION TO MIDWIFERY ATTENDANTS

BY

J L. MILLER WOOD, M R.C S., D P H., M M S A

First Assistant County Medical Officer (in charge of the Maternity and Child Welfare Sections) Essex County Council

AND

F E CAMPS, M D Lond.

Pathologist to the Chelmsford and Essex Hospital Consulting Pathologist to the Essex County Council

Recently two most important cases from the point of view of liability in connexion with puerperal infections have occurred in the High Court These rulings affect very closely those engaged in the practice of midwifery wherever it takes place—in the patient's own home, in a nursing home, or in a hospital—and are applicable both to doctors and to midwives In view of the fact that the Midwives Act 1936, which has recently come into force, places many midwives in the employment of local authorities, it follows that such authorities are responsible for cases of puerperal infection if these should arise in the course of their midwives' practice Such responsibility falls in no less measure on doctors and hospitals In view of this we have ventured to put forward the following suggestions in connexion with puerperal infections due to the *Str pyogenes* as they have been used by us for the past eighteen months with satisfactory results

We have deliberately refrained from going into details of the control of puerperal infection such as masks and dettol as this matter has already been adequately dealt with by Colebrook (1936) Since the bulk of serious cases of puerperal infection are due to infection with *Str pyogenes* Group A it is a rational attitude to adopt that all cases of pyrexia occurring during the puerperium should be regarded as due to *Str pyogenes* until proved to the contrary

In order to be able to do this it is essential to investigate such cases at the earliest possible moment This should be done by taking swabs from the cervix and throat, together with a blood culture from the patient and examining these bacteriologically Until the results are known the midwife should cease to attend any further cases If the examination yields a positive result then bacteriological examinations of swabs taken from the nose and throat of the midwife and any other contacts should be made If *Str pyogenes* is isolated from any of these it should be typed in order to compare it with the organism infecting the patient and so identify the true source of the infection

Examination of Midwives' Throats

It is a rational corollary of this that midwives throats should be examined if they have a cold or tonsillitis or have been in contact with a case of streptococcal infection such as scarlet fever At the same time they should be suspended from duty until the bacteriological investigations are known to be negative *This is most important* as it is not uncommon to trace the source of infection to a midwife who has had a cold which she has regarded as trivial At the same time it is also advisable to make sure that there are no obvious cases of streptococcal infection such as discharging ears or noses in contact with the patient before delivery It is inadvisable to swab all prospective contacts as a routine since experience has taught that swabbing of clinically normal throats for no specific reason as for example when a known case of infection has occurred will almost inevitably lead to confusion Further the examination of swabs unless performed by those experienced in working with the organism is liable to yield a high apparent positive rate

In addition to this one difficulty is an inability to be sure when the organism is in a virulent state, although there is reason to believe that if the throat is clinically normal the person is probably not infectious It has been observed by one of us that it has been possible to recover from the throats of healthy nurses the same type of *Str pyogenes* which was the cause of an acute tonsillitis a year previously, although careful investigation failed to show that any cases of infection had in the meantime occurred among persons with whom they had been in contact However, it is obvious that when once *Str pyogenes* has been discovered in the throat of a midwife it is impossible to allow her to attend any further cases so long as it remains there, lest puerperal infection be contracted by one of her patients which may be thus ascribed to her

A certain public authority, before engaging its salaried midwives, recently swabbed their throats as a routine and a high percentage of positive swabs was revealed, thus placing it in the curious dilemma of being unable to appoint midwives otherwise apparently healthy and with unblemished records without rendering itself liable to serious criticism in the event of subsequent infection occurring It would appear more reasonable to examine the throats clinically in the first instance and only swab those with a suspicious appearance

The problem which presents itself is to obtain a service of midwives who are presumably free from streptococcal infection and who, should they unknowingly infect a case, will rapidly be prevented from producing any further damage Under such circumstances should a case of puerperal infection occur it is difficult to see how any claim for negligence could succeed

Three Important Questions

At the same time if midwives are found to be harbouring *Str pyogenes* and are suspended from duty on that account the employer is liable to pay her compensation until she is able to resume duty, provided that she co-operates in attempts to make herself no longer a potential source of infection Three questions appear to be relevant

1 WHEN SHOULD A MIDWIFE BE SUSPENDED FROM DUTY?

A midwife should be suspended from duty in the following circumstances

(*a*) When she has a case of puerperal infection occur in her practice, until it is shown that the case is not due to the *Str pyogenes* or if it is due to this organism then that she is not harbouring it in her throat The fact that it is not the same type is not relevant as once the midwife is found to have *Str pyogenes* in her air passages she must cease to practise midwifery until proved negative bacteriologically At the same time other manifestations of septic infection should not be overlooked such as septic sores on the hand

(*b*) When the midwife is herself suffering from an acute infection such as a sore throat which may be due to *Str pyogenes* until proved to the contrary bacteriologically

(*c*) When the midwife has been in contact with a known case of streptococcal infection such as scarlet fever until proved bacteriologically to be free from such an infection herself

In connexion with swabs it should be stressed that these should be taken by a person who is experienced in the technique as a badly taken swab is not only useless but is misleading We have recently examined two swabs taken from the same case on the same day one by a midwife and the other by an ear nose and throat surgeon The former grew every organism but *Str pyogenes* the latter gave a pure growth of *Str pyogenes*

2 WHEN MAY A MIDWIFE SAFELY RETURN TO DUTY?

She may only return to duty when proved to have no *Str pyogenes* in her upper air passages bacteriologically

Universities and Colleges

UNIVERSITY OF OXFORD

At a congregation held on October 14 the following medical degrees were conferred

B.M.—D S Bateman D Jeffenss

UNIVERSITY OF CAMBRIDGE

Dr T Shirley Hele, Master of Emmanuel College has been elected as the representative of the University on the General Medical Council for the five years from October 22, 1937

At a congregation held on October 15 the following medical degrees were conferred

M B, B CHIR.—*H A Burt *G B Barbour, *H G Goldwater, *E W Hart, *J M Ranking, *M W H Evans *P E T Hancock, *W R S Hutchinson, *L O Mountford, *H B Pope *J F Stokes, *J C G Whitelaw, *T E Johnson, *J E V Jones, *C V Brambridge, *A G Bellamy, *W F Rhodes S G Mayer, M C H Kingdon, W A Nicholson, A F Stallard, J H G Thompson, C St A Vivian, A B Lintott, B D Molesworth, S G Brook

*By proxy

The following candidates have been approved at the examination indicated

DIPLOMA IN MEDICAL RADIOLOGY AND ELECTROLOGY.—*(Part II)* A B Brereton T H T Gautby D Gold J L King, M A M Marei, A Sirry, C P Theron

The Vice-Chancellor announces that he has received a letter from the Rockefeller Foundation informing him that, after considering the proposal of the University of Cambridge for the development of the Department of Experimental Psychology, the executive committee has made an appropriation of £11,360 towards the cost of the scheme of development. Of this sum £1 200 is allocated for alterations in laboratory rooms, and the remainder for expenses of the department for a five-year period from January 1 1938 to December 31 1942. The offer of the Rockefeller Foundation is contingent on approval of the report of the Council of the Senate on the William Charles Wilson bequest.

UNIVERSITY OF LONDON

Professor J H Gaddum Sc.D M.R.C.S. L.R.C.P, has been appointed to the University Chair of Pharmacology tenable at the College of the Pharmaceutical Society of Great Britain in succession to Professor J H Burn who was recently appointed to the Chair of Pharmacology at the University of Oxford.

A course of five Brown Institution Lectures on "A Comparative Study of Filter-passing Bacteria and Viruses" will be given by Professor F W Twort, F.R.S. on December 6, 8, 10, 13, and 15 at 5 p.m. The first four lectures will be given at the London School of Hygiene and Tropical Medicine, Gower Street, W.C., and the fifth at the Brown Animal Sanatory Institution, 149, Wandsworth Road, S.W.

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

The following candidates have been approved at the examination indicated

ACADEMIC POSTGRADUATE DIPLOMA IN PUBLIC HEALTH.—Joyce M Brockington, Sylvia C Gavron, H F Green, M U Hayat, A W Rasiah, H C Saksena, M N de S Suriyawansa, H M Vanderwall

UNIVERSITY OF GLASGOW

At a congregation held on October 16 the following medical degrees were conferred

M.D.—J Shafar

M B, CH B.—*J P O Erskine, †Mary Del Vecchio, †A Brown †A L Goodall †A. R Hunter, †A Young, ††J H Bruce, J W Affleck, Isobel C Allardyce, D M Armstrong, Margaret P Ash, A August, Mary McC Barron, J Baxter, Catherine McL Beaton, Mary L F Brownlie, J S Cameron, J Campbell, L Carmichael, T W Carrick, Margeth A Cathcart, W A W Chapman, Mary L A Chisholm, J M Clark, B Cohen, W Y Cormack, B Couts, R W Crocket, J C Davidson, W P G Dickson, E A Donegan, J H Dorman, W M Douglas, E Duffy, J J Elbert, A M Forrest, A A Gilmour, D Golombok, R R Gordon, Harriet J Grant, K C Grigor, D St. C L Henderson, Janet W Herriot, *E F Hill, A F Jarvie, H H Johnston, J J Justice, R Kellock,* H C Kennedy, R E King, A McE Lamont, A Laurie, J Laurie, P Lavery, J Leslie, W S Linton, W McAdam, Theodora J W McAlpine, J M McCrea, D MacDonald, D McGowan, J W A MacKenzie, T McLardy, J H. Ogilvie, A B I Olorun-Nimbe, G M Olswang, W Paterson, J Reid, J Richardson, *W E Smith, W B Stirling,* A. P Thomson, R Traill, D Turner, Ruth M H Winter

* With honours † With commendation

James P O Erskine gained the Brunton Memorial Prize, awarded to the most distinguished graduate in medicine for the year 1937.

The West of Scotland R.A.M.C. Memorial Prize was awarded to Robert B Wright as the candidate who obtained the highest aggregate marks in surgery, medicine and midwifery in the final M B, Ch B examinations held during 1937.

Robert E King received the Macewen Medal in Surgery as the candidate who obtained the highest aggregate marks in surgery at the final M B, Ch B examinations held during 1937.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

Primary Examination Overseas

The Council of the College has again agreed in compliance with the request of the Royal Australasian College of Surgeons to conduct the primary examination for the Fellowship in Melbourne Sydney, and Dunedin during November and December. At the request of the Director General of the Indian Medical Service the primary examination will also be conducted in Bombay early in January, and the examination is also to be held for the first time in Egypt. This is at the request of the Dean of the Medical Faculty of the Egyptian University and the examination will take place at the end of January in Cairo. Mr Cecil P G Wakeley, a member of the Council of the College and senior surgeon at King's College Hospital, has accepted nomination to act as the examiner in anatomy at each of these examinations. He leaves Tilbury on Saturday, October 23, by the R.M.S. *Orama* and will not be back in London until February 7, 1938. Professor A St. George Huggett, of St Mary's Hospital Medical School, has been able to accept the appointment to examine in physiology owing to the co-operation of the Medical School authorities in releasing him from his duties for the purpose. He will leave Croydon by air on Monday, November 15 and will return with Mr Wakeley on February 7. The Director of Examinations Mr Horace H Rew, will be responsible for the conduct of the examinations in India and Egypt. He leaves for India by air on December 29 and will return with the examiners on February 7. There are ninety-six candidates in Australasia, eighty-five in India, and twenty-two in Egypt, and at each centre the examiners will act with assessors, appointed locally by the Council of the College.

A meeting of the Council of the Royal College of Surgeons of England was held on October 14, with the President, Sir Cuthbert Wallace, Bt., in the chair.

A diploma of Fellowship was awarded to Francis Joseph Hayden and diplomas of Membership to Neil Hamlin and Arthur Morgan Spencer.

Diplomas in Child Health were granted, jointly with the Royal College of Physicians of London, to the following

M A Abboud, Ehsan Awad, Jenny D Craig, Hilla Damry, Annie M Dawson, C W Dixon, Sheila M Franklin, Gladys I Hallows, M R Kark, B W Knight, H B Lal, Margaret J T Leitch, N F Lilauwala, R C MacKeith, L K Mitra, J W Parks, Nellie M Plowright, Gwendolen F Prince, J Sakula, G Scott, J E Sewell, H J Sinn, Gwladys V Smallpeice, S K Squires, Margaret E Sutherland, G L B Thurston, H M Trethowan, Elizabeth N Warner, J R. Wilson.

Mr Wilfred Trotter and Mr W H Ogilvie were appointed representatives of the College on the Executive Committee of the Imperial Cancer Research Fund.

Dr C J C Britton and Mr D W Ashcroft were appointed Streatfeild Research Scholars to carry out research entitled "An investigation of the relationship between sinus disease and tonsillar infection."

The following were appointed Superintendents of Dissections for the Primary Fellowship examination to be held overseas shortly: *Egypt* Dr V H Assar, *India* Mr R C Motwani.

An address of congratulation to the University of Allahabad on the occasion of its fiftieth anniversary was approved. Lieut.-Colonel F J Anderson will represent the College at the celebration of the anniversary.

The following hospitals were recognized, *with the posts* specified for the six months surgical practice required of candidates for the final Fellowship examination: Crumpsall Hospital, Manchester (resident surgical officer and two house-surgeons); Royal Gwent Hospital, Newport, Mon. (first and third house surgeons).

Planning the Attack

Laboratories for the performance of specific tests and venereal disease clinics should be improved in both quality and quantity both should be free at least for those who cannot afford to pay A consultation service should be available for doctors, and drugs should be supplied gratuitously Scholarships and more adequate grants would encourage research in both syphilis and gonorrhoea Each State should have a whole-time venereal disease officer in its public health service, and every attempt should be made to foster co operation between the health services and medical practitioners, since more than half the total cases of venereal disease are treated by the latter Case finding, the follow-up of delinquents, and the search for contacts demand an efficient service of highly trained social workers, similar to our almoners this might have more effect in reducing venereal disease than any other single factor, but it is slow, laborious, and very expensive

The three most difficult problems which America has to face in this connexion are perhaps (1) the negro element (syphilis is far more prevalent in negroes than among whites), (2) the lack of funds and (3) the tendency of sufferers from gonorrhoea to apply to drug stores and quacks It does seem that at last the United States has woken up to the fact that one out of every ten adults has or has had syphilis, and that only by a thorough and energetic campaign can the public be made to realize the prevalence and seriousness of venereal diseases Until venereal disease is stamped out—which can only be done by education by an improved social conscience by an enlightened self-awareness that the game isn t worth the candle or by all three—measures of prophylaxis and treatment must be investigated, and it may be of interest to refer here to some of the work recently carried out in the U S A

Congenital Syphilis

A vast amount of information on syphilis was included in a symposium presented at the annual meeting of the American Dermatological Association in 1936 and now published A paper entitled 'Late Prenatal Syphilis, with Special Reference to Interstitial Keratitis its Prevention and Treatment,"[3] by various authors is a most valuable and instructive contribution though why the convenient word congenital should be changed to prenatal is not clear The time to attack prenatal syphilis is during gestation If however as is so often the case the diagnosis is not made till after birth, treatment begun during the first two years of life is much more efficacious than when started later The material studied in the paper under review consists of 1,010 late cases—that is of patients more than 2 years of age on admission Of these only 2 per cent had received any treatment and in only 19 per cent was there any history of lesions which shows that a high proportion survive and remain asymptomatic for some years

Interstitial keratitis was present in 33 per cent of the cases lesions of the central nervous system in 10 per cent and of the bones and joints in 7 per cent 39 per cent of the cases were latent Clinical results depended largely on the time at which treatment was begun Patients treated in the early acute stages did far better than those in whom the condition had become chronic or in whom the lesions had healed spontaneously The significance of the blood reactions is rather remarkable In early acute cases results were far better when the reaction was reversed by treatment whereas in the latent cases this was not so Serological fastness is a relative term since where a series of quantitative tests is carried out the so-called fast case is often seen to show a progressive diminution in the strength of the reaction under the effect of treatment were this done more often the expression serological fastness would almost fall into disuse

The age of the patient and the amount of treatment also have much influence on the end results Patients under 15 years of age and those treated for more than one year did better than older and less intensively treated cases respectively, when syphilitic lesions were manifest, but this did not appear to hold good in latent cases

Interstitial Keratitis

It is generally believed that active lesions, especially interstitial keratitis, occur usually in the 6 to 15 year age period, but without adequate therapy no age is free from risk In fact interstitial keratitis may start at the age of 3, is consistently high up to 20 and may appear as late as 25 Adequate therapy is defined here as not less than sixteen injections of an arsenical preparation and thirty one of a heavy metal As in many conditions the best treatment of interstitial keratitis is prophylaxis Adequate treatment prevented interstitial keratitis in 98 per cent of cases, some, but inadequate, treatment prevented it in 91 per cent, whereas only 64 per cent escaped where no treatment was given, three or four times as many cases of interstitial keratitis developed in the inadequately treated as in the adequately treated Incidentally treatment with a heavy metal by itself was found to be absolutely insufficient protection, a point of considerable importance Possible involvement of the second eye always a serious problem depends largely on the duration of the lesion of the first eye before treatment is started, with adequate treatment it is unlikely to occur after an interval of two years Success in treatment depends on early and adequate measures in no instance did blindness supervene when treatment was begun in the early acute stage whereas it afflicted four patients who were untreated In chronic and relapsing cases treatment should be supplemented with iodides and fever therapy

Syphilotoxaemia

Cregor and Dalton,[4] discussing the diagnosis of congenital syphilis, especially in the absence of physical signs conclude that the child of a syphilitic mother may present a temporary positive blood reaction and in fact suffer from a syphilotoxaemia without being infected with syphilis this is said to be due to a transference *in utero* from the mother to the child of complement-fixing substances The reaction usually persists only for ten to fourteen days but is said to persist for two to three months in rare instances The moral is that a positive Wassermann reaction in the early days of infant life is not sufficient to warrant a diagnosis of syphilis

Continuous and Intermittent Treatment

The question of continuous and intermittent treatment of early syphilis is discussed by Professor Stokes and Miss Usilton[5] in an article which they describe as a critical review of the American and the League of Nations investigation with additional evaluations It would appear rather to be a speech by counsel briefed for continuous *versus* intermittent treatment It does seem at least doubtful whether the continuous system is as continuous as the word suggests while the intermittent system is probably less intermittent than is at first apparent At all events although the League s report does not admit of accurate comparison of the results of two systems it is admitted that there is little to choose between them when given under ideal conditions What the report did disclose was that many of the good clinics are not working under the systems which their chiefs imagine them to be that as much as 20 per cent of clinical material from early cases is not being adequately

[3] *Arch Derm Syph* Chicago 1937 35 563

[4] *Arch Derm Syph* Chicago 1937 35 500

[5] Ibid 1937 35 377

attended every meeting, placed his knowledge and experience at the disposal of his colleagues, and never spared himself if, by his exertions, he could contribute to the common weal He joined the British Medical Association in 1870, was honorary secretary of the Section of Public Medicine at the Dublin meeting in 1887, vice president of the Section of Medicine in London in 1895, and delivered the Popular Lecture on "Weather, Climate, and Health" at the Exeter meeting in 1907

It is difficult now to speak of Sir John's ability as a physician, but we know that he had at one time a good practice, and his many appointments reflect the high opinion which his colleagues had of him His acute and accurate observations and his delicate and sensitive hands made him a skilled diagnostician, particularly of the fevers As a teacher he was unrivalled with young students, for he taught them how much they could perceive by the use of their unaided senses, which were almost all he himself had when he entered the profession Sir John was, in his younger days, a rower and swimmer in later life he was a walker When he gave up his victoria, some twenty years ago, he did not buy a motor car, and he rarely travelled in a tram or bus Many a Dubliner will miss him on his daily walk from Fitzwilliam Square to the Meath Hospital, a walk which on Sundays was continued to St Patrick's Cathedral, where he was a regular worshipper His bent figure and full white beard were in keeping with his years, but not his brisk step, alert eye, and friendly greeting He loved walking and the fresh air, and rarely wore an overcoat

Sir John was a learned and cultured man, a well-known physician, a writer of distinction, an influential member of many important bodies, he was of tireless energy, the soul of punctuality, ever devoted to duty, rigorous in upholding the ethics of his profession, he was a nonagenarian who was active in mind and body until his last illness All these serve to explain the admiration and respect in which he was held by his colleagues, but it was not for these that he was entitled to be called, with St Luke, "beloved physician" He was loved for his kindness of heart, his thoughtfulness of others and thoughtlessness of self, his geniality, and his unfailing good humour The writer of these lines never knew Sir John to do an unkind thing or heard him say an unkind word Coupled with his benevolence was an old-world courtesy, more in keeping with the manners of the century of his birth than with that of his death He survived all his contemporaries, but as his life flowed on he included in his circle of friends many men much younger than himself and the youthfulness of his mind bridged the great gulf of years between them and him

Moore modelled himself, as a clinician and teacher, on his predecessor in the Meath Hospital, William Stokes In an address which, as the newly appointed physician to the hospital, he gave to the students in 1875 he referred to the retirement of Stokes, and nothing would have delighted Sir John more than to know that, in the opinion of his friends, his own words about Stokes might, without alteration, be most justly applied to himself sixty-two years later— The sympathizing friend, the prudent counsellor, and the ardent well-wisher of every one of his 'fellow-students,' for so he called his pupils But he was more than this Those of you who have seen Dr Stokes at the bedside of the sick know how gentle, how refined, how kindly was his bearing towards the patient Amid all the ardour of clinical observation and research he never for one moment forgot the sufferer before him— no thoughtless word from his lips, no rough or unkind action ever ruffled the calm confidence reposed in him by those who sought his skill and care"

He has left behind his widow, one son, and three daughters To them we offer our sympathy in their bereavement, and in this sympathy we are joined by very many citizens of Dublin of every class, who by the passing of Sir John William Moore have lost a true friend

J W B

We are indebted to Professor T G Moorhead for the following appreciation

With the passing of Sir John William Moore the last link that bound Dublin directly to the medicine of his great predecessors, Stokes and Graves, the medicine of symptoms and physical signs, has been severed, and Dublin has lost one of its best known and best loved figures There can be few inhabitants of the city who have not been familiar for many years with Sir John as he walked with rapid stride from his house in Fitzwilliam Square to his beloved Meath Hospital or to the meeting place of one of the many committees of which he was a member For he was a great walker, and attributed much of his good health and his longevity to his regular exercise and to his simple habits To all whom he met on his walks he gave a cheery greeting and salutation, and often paused to exchange a word Familiar also to those who lived near him and were early risers was his appearance as he stood on the steps of his house in the early morning, pleasantly smiling surveying the day and assessing its possibilities When I myself graduated about the beginning of this century Sir John was already a past president of the Royal College of Physicians of Ireland, and was one of the seniors of and one of the acknowledged leaders of the profession For some years I seldom met him, for though he was a frequent attendant at the Royal Academy of Medicine, the meeting place of the profession, he usually stole away early to carry out his meteorological observations Then circumstances threw us together, and for the last twenty-five years I have known him intimately, and was often privileged to accompany him to and from various committee meetings and to sit by his side

Sir John was one of the most lovable and amiable of men, simple of mind and without guile, he was straightforward in all his dealings His most striking characteristic was his great courtesy, a courtesy that was unaffected and was of the very essence of his being He was courteous to young and old, to rich and poor, to his opponents as well as to those who were on his side But, though gentle and courteous in manner, he was possessed of great determination, and could defend what he regarded as right with vigour and sometimes with vehemence He had strong opinions on many subjects and could support them with much fluency and aptness of phrase and argument, nor did he hesitate to press his opinions to the test of a division If defeated he accepted defeat with equanimity, and passed on to what came next if he won he was pleased but not triumphant It was always for causes that he fought and not for his own hand, for he was one of the most public-spirited of men As a committeeman he was invaluable He always attended regularly, and took care to be acquainted with whatever business was on hand He was much learned in precedents, and was a great stickler for procedure, always insisting that everything should be done decently and in order When a difficult resolution had to be drafted or an expression of sympathy framed one turned instinctively to Sir John, knowing that he could be relied on to produce what was required, for he had the pen of a ready writer and the happy phrase came quickly to him As a classical scholar he insisted also on correct pronunciation Nothing gave him more pain than a false quantity His influence indeed in this respect spread widely, and he is responsible for the present correct

third edition of Harvey's *De Motu Cordis et Sanguinis* 1639 is bound with four foreign tracts on the circulation, the latest of which is dated 1644, it is quoted at £40 A very early monograph on paediatrics is that by Bartholomew Metlinger, printed at Mainz in 1532 this is, of course, not the first edition, but the cataloguers state that they can trace no other copy of this edition, which contains new material not found in the original issue Guy de Chauliac's *Surgery* is bound up with a pamphlet on the same topic by Johannes de Vigo, published at Lyons in 1537 and 1534 respectively A greater rarity is the first edition of Ambroise Paré's ten books of surgery, Paris 1564 of which apparently only two other copies exist—£100 the first English edition 1634, is priced at £47 10s Fallopius on syphilis Venice, 1565, contains the much debated thesis that the disease was brought to Europe by the sailors of Columbus, he favours guaiacum in preference to mercury

Messrs Francis Edwards of Marylebone High Street include two very rare old English books in their latest catalogue the first edition of Andrew Boorde's *Breviary of Helthe* both parts bound together in seventeenth century panelled calf, London 1547 (£90) of which neither the British Museum nor the Bodleian possess a copy, and *The Noble Experyence of the Vertuous Handyworke of Surgeri* practysed and compyled by the moost experte mayster Jherome first edition, London, 1525 (£85)—this author is better known as Hieronymus von Braunschweig

Persian and Arabic MSS

In addition to the foregoing some interesting Persian and Arabic manuscripts are being sold by auction by Messrs Sotheby on November 3 What is described as the finest existing ancient copy of Avicenna's most famous work *Qānūn* lacks the first leaf but is otherwise in beautiful condition, written during the period 1294–7 *A commentary on this work by Amulī, is dated 1359*, seven years later than its completion by the author There is a compendium on ophthalmology by Alī ibn Isā of the fourteenth century Another ancient MS is a commentary on Rhazes and an abridgement of Abū Alī Muskūya (both on drugs and pharmacology) written in 1225—a faultless copy Then there are several commentaries on Avicenna and other Arab physicians ranging from 1500 to 1672 Hippocrates is represented by a commentary, the work of Ahmad ibn Muhammad al Kalāi to be sold with a sixteenth century MS of Nafīs ibn Iwad on the causes of maladies There is also a treatise on opium dated 1591, by Mahmūd ibn Mas ūd Shīrāzī followed by Risāla i *Hifz as Sihha* on hygiene *1626* sold with three later medical MSS In another lot are to be found Mansūr ibn Muhammad on anatomy 1552 with two incomplete copies of the same 1664 and two more modern works on ophthalmology and dysentery respectively Lastly, one notices the first half (five books only) of Ismāil Jurjani's medical encyclopaedia dated 1349–50 an exceptionally fine and complete copy for so ancient an MS There are of course many other valuable and ancient items in the sale but they are not of medical interest

ANNALS OF MEDICAL HISTORY

The cover of the July instalment of the *Annals of Medical History*[1] bears a portrait of the handsome type of pulmonary tuberculosis and the reader finds that such a facial diagnosis was justified in the case of J D Godman an anatomical teacher in Baltimore Cincinnati Philadelphia and New York who died in his thirty sixth year in 1830 and whose hard life's struggle is sympathetically sketched by Dr W S Miller In a generously illustrated article Art History and the Crutch Dr S Epstein outlines the chronicle of the crutch which previously has been painted rather than printed Dr F C Waite analyses medical degrees granted in North America during the eighteenth century and includes an honorary degree given by Yale College in 1724 to Daniel Turner of London whose application was accompanied by a gift of books of the estimated value of sixteen pounds this was probably the author of many works on venereal disease, the opponent of Thomas Dover, a licentiate of the College of Physicians, and rather caustically noticed in Munk's Roll The connexion between the School of Salerno and Scandinavia is discussed with full documentation by Dr Reichborn-Kjennerud of Oslo This is followed by the History of Steam Sterilization, which Dr Magath traces back to 1822 when an Englishman called Wallace thus sterilized clothes In his notes on the medical history of Vienna Dr Korns gives an interesting account of van Swieten's activities in organizing the medical teaching there in the eighteenth century Dr H Silvette's fifth instalment of 'The Doctor on the Stage' contains many references to allusions in seventeenth century dramas to syphilis

RURAL HYGIENE IN THE FAR EAST

Under the auspices of the Health Organization of the League of Nations a report is issued of the Inter governmental Conference of Far Eastern Countries on Rural Hygiene The conference which was held at Bandoeng Java, in August of this year, was attended by Government delegates from thirteen Far-Eastern countries, a large number of experts in specialized fields and observers, among whom was the vice president of the Rockefeller Foundation from various interested organizations The agenda comprised health and medical services, rural reconstruction and collaboration of the *population, sanitation and sanitary engineering*, nutrition and measures for combating certain diseases in rural districts

The Function of Preventive Medicine

It was resolved that in Eastern countries, more than anywhere else preventive medicine was the cheapest means of improving the health conditions of rural populations To achieve progress in preventive work it was necessary to demonstrate its benefits thus providing an incentive for the people concerned to contribute voluntarily either money or labour The collection of accurate vital statistics was a matter of importance It *was also desirable to inaugurate as far as possible* a policy of decentralization

With regard to subordinate personnel it was advisable that their training should be simple and practical Superficial erudition was of less importance than honesty and self reliance In these Far Eastern countries medical progress is often curtailed by financial considerations An admirable recommendation advocated the formation in times of prosperity of a reserve fund to be set aside for the purpose of safeguarding the essential continuity of medical and health measures in periods of depression Other resolutions dealt with the grouping of villages within the orbit of a local health centre or unit improved methods of water supply and drainage and investigations of means for preventing the breeding of flies With regard to the question of nutrition it was necessary in order to study the relations between diet physique general health and the geographical incidence of various diseases to undertake properly conducted diet surveys Finally measures were discussed for the combating of malaria plague ankylostomiasis tuberculosis pneumonia yaws leprosy and mental diseases and drug addiction

The valuable report of this conference shows that widespread improvement in the rural health of the countries concerned may be anticipated within a reasonable time provided that adequate financial resources are available.

We have lost a singularly attractive personality Ashley was indeed a delightful companion and the best of friends Warm hearted, sympathetic, sensitive, and endowed with a pawky humour, he loved, and was loved by, his fellow men

Ashley Mackintosh had a great reputation as a teacher I speak from experience when I say that I doubt whether any university has turned out graduates better equipped for the practice of medicine and with a higher appreciation of the honourable ideals of the profession than were the students of his day He was immensely popular The interests of his students were constantly in the forefront of his mind, and he impressed them with the hall mark of his personality, which they carried far and wide Thoroughness was his motto and overconscientiousness his vice if such it can be called Many years ago he told me that he proposed to resign his chair since he found that even after deputing some of his teaching to his colleagues, it was still impossible to keep abreast of the field of knowledge to his satisfaction Fortunately he was persuaded to reconsider his decision

A fine clinician, he possessed to an unusual degree that gift which characterizes the true physician—the ability to look at a case through the eyes of the patient Not too robust he never spared himself His time was so fully occupied with his teaching and reading, with hospital and administrative duties, and with a busy consulting practice, that his contributions to the literature were unfortunately few Nor is it surprising that in his later years he should have regarded the present-day tendency of undergraduate teaching—to stress the science as opposed to the art of medicine—with some misgiving

His Alma Mater might well say of Ashley Mackintosh, "Well done, thou good and faithful servant!"

[The photograph reproduced is by Vandyk]

Dr Charles William Beresford who died at Hove on October 7 aged 83 years, had retired to that town after many years of practice in Narborough. He was the son of a doctor who had practised for forty years in that town He received his medical education at University College London, where he took the diplomas of M R C S Eng and L S.A in 1880 He had held several clinical appointments, including those of resident clinical assistant at Stockport Infirmary, house surgeon at Bridgwater Infirmary and at the Royal Isle of Wight Infirmary, County Hospital, and Fever Hospital His son, Mr Gerald Beresford, is in practice at Hove, holding the post of surgeon to the Royal Sussex County Hospital Dr Charles Beresford always took a very keen interest in cricket and was at one time honorary secretary to the University College Hospital Cricket Club He was an old style of country doctor in his early days, performing operations by candle light in cottages while giving his own anaesthetics He had a local reputation as an obstetrician He was much beloved by his patients, among whom he had lived for so long

The death took place on October 1 of a veteran member of the public health service, Dr Edward Walford who joined the British Medical Association as long ago as 1874, and for the past sixteen years had lived in retirement at Walmer Dr Walford was born in 1847, and studied at St George's Hospital, University College, London, and afterwards at Lyons He qualified as M R C S and L S A in 1869 took the Cambridge D P.H in 1881, and the M D of the University of Durham in 1884 He was for some years medical officer of health for Ramsgate Borough and Port, and was then promoted medical officer of health for Cardiff City and Port He was also director of the Cardiff and County Public Health Laboratory, and for some years lecturer on public health in the medical school of the University of Wales He resigned these appointments in April 1921 Dr Walford was a past-president of the Cardiff Medical Society

By the death of Dr William Alfred Watson of Worthing, aged 57 West Sussex has lost one of its best known doctors The death took place with tragic suddenness on October 9, when Dr Watson, who was walking in his garden with some friends, dropped dead without any warning He received his medical education at Aberdeen taking the degrees of M B B Ch in 1903, and started practice in Huntly, Aberdeenshire, afterwards coming to Worthing where he carried on his profession for twenty years, retiring in 1935 The funeral took place in Worthing on October 11 and was attended by many of his colleagues and friends, the wreaths including one from the West Sussex Division of the British Medical Association

News has been received of the sudden death at Goodna of Dr Joseph Keith Park who graduated M B, Ch M at the University of Sydney in 1892, and had been a member of the British Medical Association for the past thirty-five years He was born in Ayrshire, and went out to Australia with his parents at the age of 6 After qualifying in medicine he gained experience at the Toowoomba Hospital, then practised for many years in south coast mining towns in New South Wales, and later in Sydney

The Services

DEATHS IN THE SERVICES

Lieut.-Colonel Sir Augustus Alexander-Brooke Pechell, Bt. R A M C (retired) of Alton Hants died at Boston Spa on October 6, aged 80 He was born on July 31, 1857, and was educated at Edinburgh where he graduated as M B and C M in 1881 Entering the Army as surgeon on July 29 1882 he became lieutenant colonel after twenty years service and retired on November 23 1907 He rejoined for service during the war of 1914–18, from December 10 1914 when he held the post of deputy surgeon of the Royal Hospital Chelsea He came of an old French Huguenot family of Montauban in Languedoc Samuel de Pechels fled to England after the revocation of the Edict of Nantes and settled in Ireland His grandson served in the Army in Spain and Flanders and was created a baronet in 1797 His elder son the second baronet took the additional name of Brooke The third and fourth baronets were distinguished naval officers Sir Augustus succeeded his brother as seventh baronet in 1904 He married in 1888 Mabel, daughter of the late Major General George Briggs. His elder son, who succeeds him as eighth baronet is Major Paul Pechell, M C late Essex Regiment. His younger son was attached to the R F C and was killed flying in 1916 His only daughter is the wife of Major Bonamy Dobrée late R F A He was a member of the British Medical Association from 1901 to 1920

Colonel Gerrard William Tate C M G, D.S O late R A M C died on October 3 aged 70 He was born on November 20 1866 in Dublin and was educated at Trinity College Dublin where he graduated M B, B Ch and B A O in 1889 Subsequently he took the D P H of the Irish Colleges in 1907 and the D T M Liverp in 1908 Entering the Army as surgeon captain on July 28 1891 he became colonel on December 26 1917 and retired on November 12 1919 He served in the operations in Sierra Leone in 1898–9 receiving the medal with a clasp in the South African War in 1901–2, getting the Queen's medal with five clasps for operations in the Transvaal and Cape Colony and in the war of 1914–18 when he was mentioned in dispatches in the *London Gazette* of March 7 1918 and December 16 1918 and received the C M G and the D S O He had been a member of the British Medical Association for forty five years

Surgeon Captain Arthur Harry Hingston Vizard R N (ret) died at Southsea on October 5 He was educated at Edinburgh University where he graduated M B, C M in 1893 and M D in 1901 After filling the post of resident clinical assistant at the Stirling District Asylum at Larbert he entered the Navy He attained the rank of surgeon commander on November 14 1908 and retired with an honorary step of rank as surgeon captain on January 1 1923 He served through the war of 1914–18 He had been a member of the British Medical Association since 1923

the health services into wider and wider ranges of population And why? Because of their knowledge on the one hand, and because on the other of their close and intimate contact with the people they serve

But how can the practitioners play the part they should when the policy of the last twenty years has more and more detached them from all responsible contact with preventive medicine in the districts in which they live? Putting aside London and a few big cities the local medical services have outgrown their organization, and the work of the doctors needs a new orientation

Need for Unity of Effort

How to bridge the gap at present existing between the health services and the practising doctor how to co ordinate hospital services at present duplicating and sometimes conflicting how to secure that the best medical talent of a district shall be at the service of the medical officer of health and the local authority, how in short, to produce a unity of effort by doctors and administrators both in health and education—the solution of these problems would secure the objects of this campaign in far greater measure than relays of speeches up and down the country None the less we welcome the public utterances of the Minister of Health and the President of the Board of Education as evidence of their leadership and encouragement But in general—and I will end with this —this health campaign is an occasion when administrators need to take the advice of doctors, and for that reason among many others I give you the health of Our College'

MOTOR CARS FOR 1938

THE EARL'S COURT EXHIBITION

[From our Motoring Correspondent]

Judging from reports the first of the Society of Motor Manufacturers and Traders Exhibitions at the new Earl s Court building, which closes on October 23 has been an outstanding success Although the final figures are not yet available the daily attendance has been in excess of that of previous years and large orders have been placed by motor traders both at home and over-seas

Cars for all Requirements

The cars on view range from 7 h p to about 50 h p, and taking saloon vehicles as the standard type in price from £117 10s to over £3 000 The requirements and tastes of medical men naturally vary according to the type of practice but the saloon is probably most in favour From the standpoint of engine capacity the most suitable size will be found to lie between 12 h p and 14-h p According to the *Autocar* the modern 12 h p car is capable of giving a performance equal to that of a 14 h p vehicle of five years ago and in some cases the 8 and 9 h p cars are even more lively than the 10-h p and 12 h p productions of the earlier date Although one of the features of the 1938 vehicles is the large number of makes with four-cylinder engines those with six cylinders remain popular

What Does it Cost?

Between £117 10s and £160 there is a choice of ten makes ranging from the 8 h p Ford to the new 8 3 h p Renault with in between the 6 7 h p Fiat Balilla at £120 the Austin Seven and Big Seven at £125 and £155 respectively the popular Morris Eight at £128 the Opel Cadets at £135 and £155 the 9 h p Singer Bantam at £139 10s the Ford Ten at £150 and the Flying Standard Nine at £152 10s

Between £160 and £200 there are eleven different models to choose from including the newly introduced Vauxhall Ten at £165 the 10 h p Hillman Minx at £169 the two- and four-cylinder Jowetts at £169 and £199 the Singer Ten at £169 10s , the Flying Standard Ten at £172 10s , the B S.A Scout 10 h p coupé at £179 , the Austin and Morris Tens at £185 and the 11 4 h p Fiat Balilla and the 12-h p Renault at £198 In the price class between £200 and £250 there is a selection of about seventeen models, including a number of the new four cylinder cars At the lower end of this section there is the new Morris Twelve, the 16.9-h p Opel, and the Flying Standard Twelve, all at £205 , the Vauxhall six-cylinder Twelve and Fourteen at £215 and £225 , the Austin Twelve and Fourteen at £220 and £250 , the Singer Twelve at £229 the Citroën Twelve at £238 , the 22 h p eight-cylinder Ford at £240 the Wolseley 12–48 h p at £245 , and the new 14-h p Hillman and the Morris Fourteen at £248 Another section with a wide choice is that between £250 and £350, beginning with the Rover Ten, the Flying Standard Fourteen and the Talbot Ten all at £255 followed by the 30-h p Ford and the 14-h p Wolseley ' Six at £260 the Lanchester Eleven at £275 the Citroën Fifteen at £278 , the 18 h p Wolseley at £280 , the Triumph 14-h p at £288 the 20-h p Flying Standard Six" at £295 , the 13 2-h p S.S Jaguar at £298 , a 12-h p Riley at £299 , and the Rover Twelve at £300

There is also a wide choice in the £300–£350 class outstanding cars in this group, mostly with six-cylinder engines being the 25 h p Vauxhall at £315 , the 14-h p Armstrong Siddeley and Morris Twenty-Five at £320 the 20-h p eight-cylinder Flying Standard at £325 , the new Humber Sixteen and Rover Fourteen at £330 the 16 h p Triumph at £338 and the 12 h p British Salmson the 20 9 h p Humber Snipe and the 14-h p Lanchester at £345, with a de luxe model in the latter case at £365

Armstrong Siddeley and Austin

The Armstrong-Siddeley cars the range of which continues as before—namely, 13 17 and 25 h p—are all fitted with six-cylinder engines and for the tenth year in succession with the Wilson pre selective self-changing gear A new feature of all three models is what is known as a balanced drive, in which the usual engine flywheel is dispensed with the automatic clutch, starter ring, and change speed gear being now integral with the power unit, an arrangement which is claimed to result in much smoother running Other points of interest are the grouped chassis lubrication and the permanently fitted wheel-jacks While retaining their characteristic outline the frontal appearance of the cars has been improved and the interiors made more comfortable and roomy Two styles of 14 h p saloons are available one with six and one with four windows both being listed at £320

As usual, the Austin Company has a wide range of cars from 7 8 to 23 5 h p., including two new models—the Big Seven and a six-cylinder Eighteen The first of these is an enlarged edition of the popular Seven it has a slightly larger engine and a bigger wheelbase and track enabling a more roomy all steel four-door saloon body to be mounted on the chassis With fixed head the new car is priced at £155 or £5 more with a sunshine roof The Eighteen is produced as a roomy saloon with accommodation for five or seven persons at prices from £350 to £363 The Austin Ten Twelve Fourteen and Twenty cars are continued with various improvements in detail including Girling brakes longer and low periodicity springs easy-to clean wheels with low pressure tyres and two independent scuttle mounted screen wipers

B.S A. Citroen and Daimler

The B.S.A Company continues to confine its attention to the 10-h p Scout sports cars which are now being made in two lengths of wheelbase Features of both comprise front wheel drive and independent wheel suspension Included in the different models are two attractive coupes one at £179 and the other at £185

QUERIES AND ANSWERS

Chronic Stomatitis

'X Y Z writes For thirty years I have had a sore mouth tongue, lips and gums, the tongue and lips being the worst I have slight pyorrhoea, but my teeth are firm and periodical x-ray examinations have revealed no abnormality The mouth itself is so irritable that I cannot use the mildest antiseptic Even cleaning my teeth at night with the softest possible toothbrush causes a small ring of ulcers to appear on the lips An autogenous vaccine made from a culture of the organisms collected from the gums has been tried without avail I have been variously advised to have all my teeth out or to have nothing done to them at all It has also been suggested that the condition is a reflex one Could any reader advise me as to a possible cause and as to the best treatment? A further point about which I should be grateful for information is whether the habitual use of phenolphthalein is in any way dangerous

Resected Ileocaecal Valve

"A B writes I should value any experiences of colleagues who may have had to deal with cases in which the ileocaecal valve has been resected In one of my cases persistent diarrhoea has lasted for the fifteen years since the operation with constant ill health from debility, shortness of breath, tenderness of the abdomen etc—in short all the signs of toxaemia Consultants say it is entirely due to premature loss of valuable bowel fluids owing to the removal of the retarding influence exercised normally by that valve but they can suggest nothing helpful A dose of pil opii, 1 grain before breakfast will cause constipation for the day, but this treatment cannot be given more often than once in ten days because of the incapacitating effect of the drug

Febrifuges in Arabian Medicine

ACCURACY writes Will a student of twelfth century Arabian medicine inform me what is known to have been given to induce sweating and reduce high temperature in cases of fever? A translation of Avicenna's *Canon* has been of no assistance Kipling's Faiz Ullah in *William the Conqueror* gives his master a horrible stew of herbs What would Moses Maimonides have dosed Saladin with in a bout of malaria and could he have administered the remedy in solid soluble form (as our quinine is put up in tablets)?

Broken Sleep

WAKEFUL writes in reply to Argyleshire (October 16 p 782) I have suffered from a similar complaint for three years I sleep well from 11 p m till 4 or 5 a m and awake at the same hour whether I retire at 11 or 1 so I find it better to retire before 11 if possible Occasionally I have that heavy feeling next afternoon especially if the broken sleep has worried me or if I have made conscious efforts to fall asleep again That has been relieved in my case by two good doses of sodium bromide that day I think the secret is not to let it worry one Many of the world's best workers have lived long on four hours sleep a night

Income Tax

Local Appointment Expenses

"INQUIRER' holds an appointment under a local authority, and inquires as to expenses incurred (*a*) as subscriptions to various societies, and (*b*) in travelling for evening work

*** In each case the question is governed by judicial decisions, based on the statutory requirement that to be allowable the expenses must be incurred wholly exclusively and necessarily in the performance of the duties of the office As regards (*a*) such subscriptions have been held not to be 'necessary' unless membership of the society in question is required by the appointing authority As regards (*b*), if the travelling expense is incurred in going about from one place of employment to another it is allowable but not if it is incurred because the normal place of work is away from the residence—for example, if the expense is analogous to the cost of the city clerk's season ticket from the suburb where he lives to the place where he works

Car Transactions

"W E changed his car in 1936–7 selling an A 16 for £35 and buying a W 10 for £220 He had claimed wear and tear and the written-down value of the A car was £59 Also in 1933 he sold an A 12 for £100 and bought a second hand A 16 for £160 Is it now too late to make a claim?

*** As regards the 1936–7 transactions, 'W E can claim an obsolescence allowance of £59 that amount to be regarded as a professional expense of the year 1936–7 An obsolescence allowance can be claimed within six years *provided that a return was made for the year concerned* W E can therefore apparently claim an obsolescence allowance for 1934–5—that is as an omitted expense of 1933—the amount of the claim being the written-down value of the A car as at the end of 1932

LETTERS, NOTES, ETC

Milk for Infants in Madrid

The following letter has been received for publication from the National Joint Committee for Spanish Relief, 53 Marsham Street, London S W 1 it is signed by Lord Addison Professor Winifred Cullis Professor J B S Haldane Mr Somerville Hastings and Dr Julian S Huxley Those who are interesting themselves in youth's appeal for a hundred thousand tins of milk for Spanish babies for which a special effort is being made this week through the self-denial scheme will be interested to know that already a very fair proportion of the desired amount has been collected Unfortunately approximately 10 per cent of the milk sent in is not of the right quality for infants May we therefore emphasize that it is essential that all tins of milk contributed should be *full cream* for the situation in Madrid to-day is such that newborn babies are dying in large numbers because their mothers on account of the horrors of the bombardments have been quite unable to feed them There is an almost total lack of any form of suitable milk not in Madrid alone but in the villages of Catalonia which now harbour some half a million women and children, refugees from other parts of Spain While the appeal during self denial week is for a hundred thousand tins of milk, this is only a minimum objective the more tins above a hundred thousand that can be collected the better

Medical Golf

The autumn meeting of the Medical Golfing Society was held on the links at Prince's Sandwich on October 9 and 10, in perfect weather and the course was in excellent condition The results of the competitions were as follows Singles 1 Bogey first E Canton Seward handicap 6 (all square) second T. H P Kolesar scratch Foursomes 1 Bogey first T H P Kolesar and C H Housden (1 up), second L Bromley and J Grace Canny Ryall Cup first S Pope 88 less 14, 74 second J Livingstone handicap 9 D McGrath, handicap 4 Harold Chapple handicap 11 *tied at 76*

Singer, S S Jaguar, and Flying Standard

The models shown by the Singer Company include the 9 h p Bantam at £139 10s and £149 10s, a new Ten at £169 10s or £189 and a Twelve at £229 or £239 The different models have an improved frontal appearance, engines are all of overhead valve type while the equipment includes all modern fittings The 1½-litre or 14-h p S S Jaguar, the five seated saloon, is priced at £298

The Standard Company exhibited a series of Flying Standards ranging from the well known Nine to an eight-cylinder Twenty at prices varying between £152 10s and £325 Although there are no important changes in these popular cars the frontal appearance has been improved by the adoption of a new and distinctive radiator grille The Nines and Tens like the Twelves and Fourteens are fitted with four cylinder engines, there being in addition to the V8 a 20-h p six-cylinder vehicle One of the most attractive of the range is the Twelve, available either as a saloon at £205 or as a drop head coupé at £245

Talbot, Triumph, Vauxhall, and Wolseley

The Talbot Company introduces a new 28 8 h p six-cylinder car with independent front wheel springing, the popular Talbot Ten is continued with numerous mechanical improvements and new designs of bodywork, which includes a saloon at £255 and a foursome drop head coupé at £285

For the 1938 season the Triumph Company is again building cars of three engine sizes—11 8, 13 9 and 15 7 h p —the first two having four-cylinder engines, the other being a six' Details of the different cars, prices of which range from £288 to £388 comprise sunshine roofs ' biflex" headlamps and Dunlopillo rubber-cushioned upholstery

The Vauxhall Company this year showed a Ten four-cylinder model at a popular price Noteworthy points in the new car, which is listed at £168 in standard and £182 in de luxe form are the independent front wheel suspension overhead valve engine hydraulic brakes, and the combined steel body and chassis construction The well known Vauxhall 12 and 14-h p six-cylinder cars are being continued as last year, the former with a saloon body at £215 the Fourteen at £225, and a coupé at £245 The biggest Vauxhall the 25 h p six which sells at £315, has been improved in various directions among the new departures being an all synchromesh three speed gear box articulated metal rear spring gaiters silent-bloc oilless bushes to the back springs a built in car heater and a device known as a defroster added to the windscreen to remove any sleet or snow which may collect on the glass in bad weather

Finally there are the Wolseley cars the 1938 range of which comprises a 12-48 h p four-cylinder and 14 16, 18 20, 21, and 25 h p sixes Some of the distinctive qualities of the new Super series are what is known as phase suspension" springing which is claimed to prevent bouncing and swaying when travelling at speed the roomy bodywork giving comfortable accommodation for five persons and the ample luggage space The new 12-48 h p model is priced at £245 or £256 with sunshine roof and other special fittings the other models range from £280 up to £750

American and Canadian Models

As usual there is a large display of American and Canadian cars mostly six-cylinder engines of between 20 and 30 h p at very attractive prices There is also a separate section for what is known as customer built motor bodywork which appeals to those motorists who prefer and can afford to have chassis fitted with bodies to suit their own particular tastes Prominent among the exhibitors in this section are Mann Egerton and Co., Ltd., with Humber

Useful Accessories for Winter

Despite the fact that nowadays cars are supplied with almost every necessary fitting, the accessory section of the Exhibition always reveals a number of devices which add to the general convenience of motoring Of special interest are the many headlamps designed to meet the new car-lighting regulations, and for use during the winter months anti-freezing preparations engine warmers and garage heaters The electrical equipment of doctors cars particularly the batteries, are among the most vulnerable components owing to the load thrown on the accumulators by reason of frequent starting and stopping of the engine In this connexion attention may be drawn to the improved types of Exide Oldham Lucas and other batteries, and to the Westric battery charger of the Westinghouse Company In most private garages a supply of electricity is now available, so that with a Westric installed battery troubles may be reduced, as it is only the work of a moment to connect it up to the car and so give the accumulators a useful ' boosting " charge during the night The Lucas Company has made an improvement in connexion with the current producer or dynamo fitted on cars, consisting of a thermostatic addition to the compensated voltage control equipment as a result of which, in cold weather the operating voltage of the regulator is increased The advantage of this device lies in the fact that an increased charge is passed to the accumulator during the first half-hour of running when the temperature under the engine bonnet is below normal Still another section of interest in the accessory display is that devoted to sparking plugs among the well known makers of which is the Lodge Company Attention may be drawn to radiator muffs, such as the Fabram, to keep the engine and radiator from getting cold during long stops in the winter months

C J W

Reports of Societies

PHYSICAL RESEARCH IN PSYCHIATRY

In the Section of Psychiatry of the Royal Society of Medicine, on October 12, Dr Edwin Goodall delivered his presidential address, taking as his subject physical research in psychiatry and dwelling also on the need for research into hereditary factors and for a system of *pedigree keeping*

Dr Goodall began by remarking on the comparatively small improvement which had been effected in the recovery rate in psychotics comparing the late eighties when he began his professional career at Bethlem with the present day He attributed a good deal of the lack of progress to the neglect of the study of human genetics in general and of the heredity of the psychoses *and psycho*neuroses in particular More and more did the importance of the hereditary factor alike in comparatively trivial and in more serious illness become manifested and in no branch of medicine was the subject of inheritance more in need of attention than in psychological medicine—a pretentious term which he disliked The same unreliable and incomplete history taking was practised as obtained a generation ago Indeed the history returns like those of income tax, became more cunningly comprehensive after receiving the attention of various committees but pedigree keeping in health and disease had not yet been established

Cerebral Histology and Biochemistry

He went on to make some reference to the valuable early work which had been done on the morbid histology of the cerebral cortex in acute psychoses The institutions in this country in addition to Bethlem in which some

tion, which occurred in a male aged 30 It adhered to and had penetrated one pole of the kidney but this was a late occurrence, for there were no signs of pressure on the kidney or ureter It recurred in an inoperable form within three months of comparatively complete removal Diagnosis is aided by radiography of the renal and alimentary tracts, but is not usually complete until operation which is probably best begun through an abdominal incision

323 Low Gall-bladders

T Talamud (*Rev Asoc med Argent* March–April 1937, p 354), who records twenty cases in patients aged from 15 to 71, states that the mechanism responsible for a low position of the gall-bladder is very variable There may be ptosis of the liver enlargement of the organ, or a mesocolon of considerable size The first degree of descent of the gall-bladder is that which occurs when the fundus reaches the level of the upper border of the fourth lumbar vertebra when the patient is in the prone position Of the patients 50 per cent were definitely ill with calculous or simple cholecystitis, and in other cases the cholecystitis was atypical, and the patients complained of persistent headache, migraine, and colitis Duodenal intubation very often had a negative result In only one case was a very dark bile obtained The condition is often mistaken for chronic appendicitis, but rarely for acute appendicitis It may fail to yield to medical treatment and cholecystectomy may be required

324 Fracture-dislocations of Cervical Vertebrae

W Cone and W Turner (*J Bone Jt Surg* July, 1937, p 584) point out that the cervical spine is particularly liable to injury because of the weight of the head and the mobility of the cervical vertebrae Indirect violence is the usual cause of serious injury Fracture-dislocations can be readily reduced and maintained by plaster and other supporting jackets, but recurrence may take place and the deformity increase unless further treatment is carried out Immediate death due to respiratory paralysis is not uncommon when the deformity recurs suddenly in the upper cervical region Sudden transient quadriplegia due to slight trauma occurred in some cases Out of thirty-six cases of injury to the cervical vertebral column there were twelve in which the skeletal muscular, and ligamentous involvement was such that operative intervention and fusion was necessary Six cases are described in which bone grafting was carried out The grafts were taken from the rib, tibia or ilium, and parallel grafts were used As soon as the wound permitted, plaster fixation of the head, neck, and torso was undertaken and the skeletal traction removed Plaster immobilization was maintained for six months, but the patients were allowed up as soon as their motor power was adequate In all cases the end-results were good The authors consider that fusion is indicated when more than one of the bony structures are injured, when fracture of the odontoid is present, when deformities recur after reduction and immobilization, and when there is paralysis of the neck muscles due to cell involvement of the anterior horn Bone grafting ensures greater protection and allows the natural repair of the damaged vertebra to take place

325 Mesenteric Vein Thrombosis

R Weizel (*Dtsch med Wschr* July 16, 1937, p 1118) does not consider that the clinical diagnosis of mesenteric vein thrombosis requires superhuman skill or intuition, for in the course of two years he has recognized three such cases before death and has verified the diagnosis at necropsy In his first case that of a married woman aged 48 the diagnosis of mesenteric vein thrombosis saved the dying patient from the discomforts of an exploratory laparotomy Common to all three cases were phenomena which the author groups under three main headings (1) there were abdominal manifestations with colicky pain diffuse rigidity of the abdominal wall, vomiting, and diarrhoea, (2) cardiovascular collapse was profound and (3) there were disturbances of a nervous and psychic character culminating in the clinical picture of hepatic coma The attack of abdominal pain, etc, was sudden, but the author was able to distinguish it from that produced by biliary or renal calculi, appendicitis, or perforation of an ulcer Differential diagnosis between thrombosis and peritonitis was assisted by the yielding in all three cases of the abdominal wall on careful palpation although the palpation induced violent pain In none of the three cases was intestinal obstruction indicated by retention of stools and flatus faecal vomiting or great distension of the abdomen The psychic manifestations were puzzling and in the first case consciousness was retained until the end, although the patient was very slow in answering questions She was also restless picking at the bedclothes and trying to get out of bed at night The second patient also remained conscious until death, but was dazed and apathetic

Therapeutics

326 Oral Hygiene in Dyspepsia

S Lossius (*Nord med Tidskr* July 31, 1937, p 1214) is in charge of the dental department of the Norwegian Ullevaal Hospital where, since 1933, patients admitted to other departments for various forms of dyspepsia have undergone systematic examinations of the mouth and teeth Up to the end of 1935 328 such patients had been examined They were classified in three main groups as follows 161 suffered from gastric or duodenal ulcer, 50 from gastritis and 117 from less well defined gastric disturbances These patients were further classified according to whether their oral and dental conditions were very bad as in 171 cases, or good to passable as in 157 cases The application of this classification to a control group of 328 patients suffering from diseases of the skin and organs other than the stomach showed that only eighty of them suffered from very bad oral and dental conditions, whereas 248 could be admitted to the better group The ulcer group showed the highest rate of defective teeth and mouths, the gastritis group coming second in this respect, and the group including ill defined gastric disturbances contained approximately only half as many bad dental and oral cases as did the ulcer group Only some of the patients submitted to skilled treatment of the mouth or teeth, and their subsequent conditions, classed according to whether they did or did not receive such treatment, proved its value conclusively It was found on inquiry that of the patients not receiving oral treatment 21 per cent had to be readmitted to hospital and only 17 per cent were symptom-free The corresponding percentages for the patients given oral treatment were 10 and 30 Hence the author's conclusion that dental and oral treatment plays an important part in certain common diseases of the stomach

327 Convalescent Serum in Acute Articular Rheumatism

A B Matera R Pellerini and J C Milhas (*Rev Asoc Med Hosp T de Alvear* November–December 1936 p 440) record the case of a woman, aged 26, who developed a severe attack of acute articular rheumatism complicated by endocarditis and purpura haemorrhagica A blood count was done and showed 3,910 000 red cells and 14 200 leucocytes, with 73 per cent haemoglobins A differential white cell count showed 85 66 per cent polymorphonuclear leucocytes no eosinophils or basophils 2 33 per cent large mononuclears 10.33 per cent lymphocytes, 1 61 per cent normoblasts, 68,000 blood platelets,

employers the police, and others supplied additional information In the following findings an association between the characteristics in question and the influence of parental alcoholism was assumed to exist only in cases in which the probability of deviation due to chance was below 2 per cent.

Results of Investigation

The average age of each group was 18½ years

The physical measurements and vital capacity were slightly better in the alcoholic group but the controls appeared to be less liable to morbid physical states

The average intelligence in both groups was slightly below 14 years The school standards attained were almost identical and there was no significant difference between them in regard to attendance and conduct Some deviation from normality was shown by 26 per cent of the alcoholic group and 23 per cent. of the control group Of this total 2 per cent. of the former and 3 75 per cent of the latter were certifiable as mentally defective 0.5 per cent of the controls alone were certifiable as insane Evidence of epilepsy or one of the psychoneuroses was noted in 5 per cent. of the alcoholic group and 1 25 per cent of the control group 11 per cent of the alcoholic group and 6 per cent. of the control group showed temperimental aberrations those predominating in the alcoholics being undue aggressiveness and irritability The remaining 8 per cent of the former and 11.5 per cent of the latter were composed of those of retarded or subnormal intelligence Alcoholic habits were not observed in the delinquents of either group

The proportion of decent artisan and slum dwellings occupied by those in the alcoholic group was about 1 to 1 whereas in the controls it was almost 2 to 1 About 2 per cent of both groups lived in superior" homes Overcrowding was present in about 24 per cent of the homes of both groups

Criminal immoral or drunken habits were present in the siblings of 6 to 8 per cent of both groups 5 per cent of the alcoholics and 9 per cent of the controls had no siblings Of the alcoholic group the male parent was affected in eighty-one instances the female in fourteen and both parents in five

Of the alcoholic group 16 per cent and of the controls 58 per cent had an apparently judicious upbringing but lax indulgent harsh repressive or improvident conditions were most often found in the homes of the alcoholic group The response to these adverse conditions was principally one of resistance or submissive discontent

The employment records of the alcoholic group indicated more often than did those of the control group little or no advance or actual deterioration and there were also more frequent changes of work

Of both groups 4 per cent engaged in gambling or betting. The boys in the alcoholic group showed less inclination to take part in organized games or athletics or to associate with others in criminal offences

The average number of convictions of the alcoholic group was 1 9 and of the controls 1 5

Offences against the person (5 3 per cent.) and against discipline (13 per cent) were more frequent among the alcoholic group those against property (69.2 per cent) being more frequent in the controls Sex offences occurred in about 2.5 per cent of both groups

Destitution was present in about 12 per cent of the alcoholic group and 6 per cent of the control group

General Considerations

Significant differences between the two groups were found in the parental influence and the offender's reaction to it and to his siblings the nature of the offence committed the number of previous convictions and the material state of the homes Other differences which could not be regarded as significant owing to the smallness of the sample were the amusements temperamental aberrations physical measurements and the frequency of changes of work Poverty alone or the proximity of relatively affluent and needy homes or districts was not regarded as a common cause of crime and poverty arising from extravagant expenditure on drink uncomplicated by other factors did not differ from that due to other causes The higher proportion of crimes against property in the control group was attributable to the desire for adventure or to provide for pleasure both of which implied tendencies to associate with others, a characteristic which lads of the alcoholic group did not appear to have to the same extent The presence of a feeling of humiliation and reserve associated with defective sentiment formation in the alcoholic group might account for the reduced dependence of that group on human relationships Continued drinking occurred more often with a subcultural heredity, and appeared to be responsible for the offences associated with destitution Intermittent drinking and irregular fluctuation in the family background were associated, it was thought, more often with a psychopathic or neuropathic heredity which was, in fact, the predisposing cause of criminal conduct in such cases, alcohol being secondary to it In only a small proportion of cases was delinquency attributable to alcohol alone

---

NURSING OF THE SICK

At the opening meeting of the session of the Medical Society of London on October 11 Mr J E H Roberts F R C S was inducted to the chair by his predecessor, Sir William Willcox, and gave a presidential address on sick nursing

Discussing the reasons for the shortage of candidates for the nursing profession, Mr Roberts said that woman had now everywhere emerged from the home and in *numerable occupations were open to her The callings* in which an educated girl could earn her own living and at the same time feel satisfied that she was doing something worth while and exercising her brain to advantage increased every year The continuance of the hospital system and indeed of the health services as a whole, was dependent on the supply of a sufficient number of trained nurses The number employed by the London County Council for example, had doubled during the last ten years It was evident, therefore, that the conditions under which nurses were trained and employed must be brought more into harmony with modern social conditions if there was to be adequate recruitment The problem could not be solved without taking into account the changed mental outlook of the girl of to-day and the conditions in other occupations which competed for her service

The Training of the Nurse

The *Lancet* Commission (1932) classified prospective candidates in three groups according to their proficiency and the type of school in which they received their final education Mr Roberts said that he had known admirable nurses who received their education in the elementary school but nowadays the ladder from the elementary to the higher school was not difficult to climb by any girl capable of taking advantage of it and if she was not thus capable she was probably not of the standard for registration At the same time while a candidate should give proof of a standard of general education enabling her to take advantage of the training she was to receive if too high a standard were demanded it would mean that a large number of women likely to make admirable nurses would be lost to the profession It was stated that one of the major reasons for the shortage of candidates was the gap between leaving school at 16 or 17 and entering hospital at 18 or 19 The Association of Headmistresses had stated that for girls staying at school until 18 or 19 courses could be arranged and indeed various education authorities had already started courses There are great

stimulation of the perineal region In cases of mass reflex response to micturition the lower the lesion in the cord the less complicated is the reflex, which appears to be a release phenomenon In this instance the pathways carrying normal vesical sensation had been destroyed, but posterior column sensation was unimpaired When automatic actions of the bladder began contraction was associated with severe pains in the urethra, and this was in turn associated with painful contractions of striated muscle, although the spinothalamic tracts appeared to be functionless Conversely, reflex contraction of the bladder could be induced by painful stimuli applied to the perineum, vagina, and pubis It must be presumed that the painful stimuli had passed up the posterior columns, which appear to have conveyed the sensation of muscle cramp, and that this pain response had supplanted the ordinary vesical sensation

333 Korsakoff's Syndrome

A Brunerie and P Moitel (*J Med Lyon* July 5, 1937, p 389), since May, 1936, have been injecting large doses of urotropine intravenously in the treatment of cases of Korsakoff's syndrome They consider that the liver is the organ which is chiefly at fault in this condition, and the urotropine is administered with the idea of correcting hepatic derangement by increasing the defensive functions of the liver cells Female patients predominated in their eight patients, aged from 43 to 53 The dose of urotropine was usually 10 c cm of a 25 or 50 per cent solution, and this was given daily for twelve to twenty days The first signs of improvement were commonly seen in the digestive system The liver diminished in size, the appetite improved, and diarrhoea disappeared Most of the patients showed great improvement as regards both psychic and polyneuritic symptoms The authors are accustomed to consolidate the results by the later administration of liver extract by the mouth and by injection

Obstetrics and Gynaecology

334 Diagnosis of Ectopic Gestation

H Buschbeck (*Zbl Gynäk* August 7, 1937, p 1877) stresses the importance of the character of the bleeding in the diagnosis of extra uterine pregnancy He distinguishes and illustrates three types of haemorrhage—namely (*a*) cases of amenorrhoea only, (*b*) amenorrhoea followed by continuous haemorrhage, (*c*) atypical menstruation followed by a free interval and then continuous haemorrhage Any of these types should raise the suspicion that an extra-uterine pregnancy is present

335 Cervicitis

J R Goodall and R M H Power (*Amer J Obstet Gynec*, June, 1937, p 1050) advocate the radical treatment of cervicitis which may be of a chronic interstitial type with fibrotic change, or of an acute catarrhal type with cyst formation It commonly follows an abnormal puerperium, and the types overlap When both superficial and deep inflammatory reaction occurs, thrombophlebitis with sloughing follows and cervical polypi form The authors stress the frequent occurrence of cystic disease about the os internum with partial occlusion of the canal and defective drainage The glands about the internal os are apt to be specially affected, and noticeably so in tuberculosis Infection gradually spreads to the external os, which is found to be opened, above the os internum it is limited to the deep layers Causative agents are microbic chiefly streptococcal, traumatic, chiefly parturition with defective drainage in the supine position, and individual predisposition to disease of the mucous membranes There are symptoms of leucorrhoea and backache, but no pain unless and until the infection spreads to the adnexa Salpingitis may follow many weeks later Mild chronic endocervicitis is cured in nullipara and early post-partum cases by cautery of the lining epithelium only The external os is safeguarded by using a nasal cautery heated only at the tip This is introduced cold, and is heated to a dull red only until the cervix turns almost white Ectropion is treated by radial tracings to just beyond its margin Nabothian cysts are punctured The area is covered with sterile paraffin, and douches, if necessary, are begun twenty-four hours later Function is restored in about thirty days The cautery should be applied to the cervix immediately after a menstrual period or it may cause irregularity It is contraindicated in disease of the adnexa, and thus often in gonococcal cases, and in vulvo vaginal infection Treatment of the enlarged fibrotic cervix by cautery or amputation is condemned The similarity between gonococcal and streptococcal infections of the pelvic organs is emphasized

Pathology

336 Widmark's Test

H Schücrle (*Wien klin Wschr* August 6, 1937, p 1150) has investigated the specificity of the Widmark blood test for the diagnosis of alcoholic intoxication and the possibility of a misleading reaction following the consumption of fruit He found that after a large quantity of fruit had been eaten there was a slight increase in the value of Widmark's reaction, such as might be observed after one or two glasses of beer had been drunk In practice, therefore this test remains valuable for the determination of drunkenness

337 Sedimentation Tests in Cancer

P Jacoby and J Spotoft (*Hospitalstidende* July 6, 1937, p 811) have since 1932 systematically applied the blood sedimentation test to the patients attending the radium station in Odense, Denmark This test was employed not only before and during x-ray and radium treatment, but also at the half-yearly or yearly follow-up examinations Evidently a high sedimentation rate in cancer depends chiefly on the parenteral absorption of proteins derived from inflammatory reactions and necroses of new growths, and not on their actual size or rate of growth The sedimentation test is therefore of little value in diagnosis or differential diagnosis In the authors experience it is of great prognostic value Putting the limit between the normal and a high sedimentation rate at 15, they applied this test to fifty-nine cases of cancer of the breast before any treatment had been instituted, and they found that in the first stage of the disease this rate was almost invariably normal, whereas in the third stage it was normal in only seven and it was high in fifteen As the sedimentation test is apt to undergo considerable fluctuations during treatment, the authors have studied its behaviour twelve months or more after the institution of treatment, and they have found a remarkable difference according to whether the patients had or had not developed metastases Of fifty one patients treated for cancer of the breast and subsequently showing no objective or subjective evidence of disease, the six who had been symptom free for more than sixty months all showed a normal sedimentation rate, and the shorter the interval of freedom from symptoms between treatment and the sedimentation test the lower was the proportion of cases in which it was normal Nearly all the patients developing metastases secondary to cancer of the breast showed a high sedimentation rate, indeed, among thirty nine patients with such metastases it was only normal in two Hence the authors conclusion that when the sedimentation rate is consistently high in a patient who has been treated for cancer of the breast the prospects of recurrence of the disease are great

of the drug and a tendency to relapse" In a brief discussion of the action of tobacco on the various systems of the body Dr Rolleston remarked that though in most cases little harm was likely to ensue from a mild degree of smoking, some smokers even of many years standing were liable to develop toxic symptoms after only a small amount of tobacco, while a considerable proportion of all tobacco consumers smoked to excess Addiction to tobacco was often associated with other injurious factors, such as alcohol syphilis, tuberculosis, diabetes, etc., which might be wholly or in part responsible for various morbid conditions in smokers, but, the speaker declared there was ample justification for regarding tobacco as responsible for any symptoms which ceased on abstinence from smoking and returned on resumption of the habit

Local News

SCOTLAND

Deaf Persons in Scotland

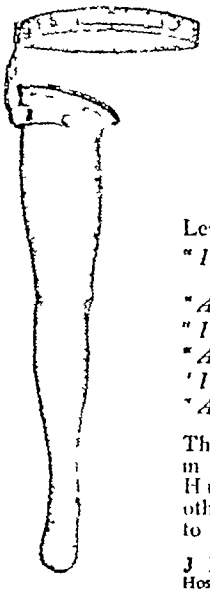
Out of some 250 000 Scottish school children examined by the health inspectors last year about 70 000 were found to be suffering from defects, either slight or major, of the ear throat, and nose This statement was made by Mr Walter Elliot when unveiling a commemorative tablet on the new extension block of the Glasgow Ear, Nose and Throat Hospital on October 15 He said that most of these defects were comparatively minor, but 2,000 children had been found to have discharging ears which might have grave consequences In Scotland there were some 5,000 people who were markedly deaf and in many of them the condition might have been prevented if they had received attention at an early stage

Glasgow Royal Samaritan Hospital

The report for 1936 of the Royal Samaritan Hospital for Women Glasgow states that 3,217 patients were treated during the year and the number of operations was 2,788 The aetiological factors concerned in the production of pathological lesions in this series are analysed, showing injury associated with childbirth as predominant Other factors influencing large numbers of cases were infection associated with child bearing and the presence of new growths (tumours or cysts) The report gives a brief summary of each of twenty-eight cases which ended fatally These include one of leukoplakia, in which death resulted from pulmonary embolism ten days after vulvectomy, one of cystocele and rectocele treated by anterior colporrhaphy and colpoperineorrhaphy, followed by an embolism of the left pulmonary artery twelve days later and one of carcinoma of the cervix treated by radium therapy death occurring from coronary thrombosis after four days In the radiological department all branches except deep x-ray therapy shared in an increase of cases and the report states that the follow up system, especially in cases of carcinoma of the cervix is beginning to furnish interesting and valuable information

International Exhibition of Cripples' Work

The object of the fourth International Exhibition of Cripples Work, which was opened in Edinburgh on October 14 by Mr Walter Elliot Secretary of State for Scotland and for which exhibits had come from all over the British Isles and from various places abroad was to stimulate interest in the welfare of crippled people so that they might be enabled to take their place in the industrial life of the nation Mr Elliot said that the Central Council for the Care of Cripples had undertaken a very great work which had two aspects—preventive and curative It was conducting a survey of the orthopaedic needs of Scotland which, he believed, would give valuable results The graver forms of crippling, from rickets or tuberculosis, that were present only a few years ago in Scotland were now rarely seen, as also was the terrible spectacle of a child locked up for a lifetime in a cage of misshapen bones But there was still a great deal to be done Last year in Scotland nearly 40 000 insured persons were off work for over 1½ million days through injuries, and it had been found that education could do a great deal to shorten the period of incapacity and to minimize permanent injury Orthopaedics was a new science, but one in which rapid and effective progress was being made The science was perhaps a little in advance of the practice, but exhibitions like this showed how much was available in the way of treatment which should be used more extensively by citizens as a whole



The opening ceremony on the second day was performed by the Earl of Dudley, chairman of the Central Council and on the third day by the Earl of Home The Earl of Dudley said that the exhibition was the finest one which the Council had so far organized Those who had had the opportunity of seeing the development of these exhibitions must be struck by the way in which they had improved during the last few years in scope, workmanship, and design It had been rightly said that when cripples were taken in the earlier stages 75 or 80 per cent could be cured by modern methods, and the remaining 20 per cent so far helped as to be no longer a burden on the community or on their families At present there were over 200,000 persons in Great Britain awaiting or in need of orthopaedic treatment of some sort

ENGLAND AND WALES

Surgical Instrument Makers

The annual dinner of the Surgical Instrument Manufacturers Association was held at the Holborn Restaurant, London on October 15, under the chairmanship of Mr H. G R Drew, the president. Professor Hugh Cairns congratulated the association upon the maintenance of its high ideals of efficient craftsmanship, as evidenced especially by the recent establishment of the Institute of British Surgical Technicians In his early training as a surgeon no account had been taken of instruments at all It was rather a tradition at his hospital that at operations the surgeon had only to put out his hand and the appropriate instrument was placed in it Eleven years ago on returning from the United States, he brought with him some beautiful instruments the like of which he had never seen in this country When in due course some of them broke he was on the point of sending to America for fresh supplies, but it was represented to him that they could be replaced by surgical instrument makers in London and this being done he found himself in possession of better instruments than he had brought from America Since then he had been increasingly impressed with the results of British workmanship in this field Nothing was too much trouble for the workers to take in carrying out his suggestions and designs The good craftsman was also invariably a man of good manners one moreover who understood the psychology of surgeons often better than the surgeons did themselves This was apparent in the facility with which they gave new names to their instruments obviously based on knowledge of the surgeon and his work Surgical instrument making appeared to ensure longevity some of the men in that company could recall the big leap that surgery took in the eighties He would be a bold man, Professor Cairns continued who prophesied the future of surgery In every generation it was said that surgery had reached its zenith that was indeed, said just before Lister introduced the antiseptic principle One thing certain was

"Solvitur Ambulando"

The great advances in recent years in prostheses for the lower extremities are exhaustively described and illustrated in a 72-page book under the above title.

Copies gratis to the Medical Profession on application

Leading members of the Profession write —

"I congratulate you on this interesting instructive and artistic production I consider it to be a very great addition to my library"—M B, Ch B, F R C S

"A very excellent brochure on artificial limbs"—M S., F.R C S

"It will prove most useful for reference"—M D LL D F R C S

"A most exquisite production and I am glad to have it"—M S M D F R C S

"I congratulate your firm on the excellence of this book"—M A Ch M M B F R C S

"A delightfully produced book"—K C M G M B B S, F.R C S

This book is the result of practical experience gained in rehabilitating over **100,000 amputees** by the Hanger establishment Many times larger than any other limb makers in the world It is devoted solely to making and fitting artificial limbs alone

and chronic obstruction of the small intestine With regard to the first subject, there appeared to be considerable unanimity of opinion as to the inability of various tests such as analyses of the gastric juice and exploratory laparotomy, to reveal cancer of the stomach in an early stage A macroscopic examination of suspect tissues was generally held to be totally inadequate when it was a question of early cancer, and the system considered most likely to lead to an early diagnosis was an interplay of clinical and radiological methods over a period of some weeks

Mode of Administration of BCG

Up to the last, Calmette insisted that BCG should be given by the mouth rather than by any other route In doing so he sacrificed scientific accuracy to psychological factors Had he done otherwise and insisted on hypodermic or intracutaneous injections, with all their concomitant terrors for the lay mind, he might possibly have robbed thousands of the benefits of vaccination by the mouth for what they were worth Now there seems to be a tendency to desert the oral route in favour of the subcutaneous route, which, however much it may betray the pusillanimity of certain family doctors is to be preferred on account of its greater accuracy It is probably the work of Wallgren of Gothenburg which has done more than anything else to convert the Calmette school Among the converts in this respect in France are Dr Paraf and Dr Boissonet of Paris They no longer believe in the wisdom of giving newborn babies BCG by the mouth save in the most exceptional circumstances What they advocate is waiting till a child is several years old and giving him BCG by subcutaneous injection only after searching tests with Pirquet s and Moro s reactions have shown him to be definitely tuberculin negative

X ray Victims

Dr Noiré who has just died, was the victim of x ray dermatitis which began as long ago as 1915 He started his medical career at the Saint Louis Hospital, and he collaborated with Tennesson and Sabouraud. He was a pupil of Dr Antoine Béclère, with whom he worked in connexion with the *x* ray treatment of ringworm he also did much to advance the technique of radiology in certain fields Only a few days ago the radiologist, Professor Charles Vaillant, underwent his fourteenth operation for damage inflicted by *x* rays His first attack of *x* ray dermatitis dates back some twenty years At present he lives at the Hôtel des Invalides, and his many friends hope that this last operation will have proved perfectly successful

---

Sale of Food and Drugs (H M Stationery Office, 4d) comprises extracts from the annual report of the Ministry of Health for 1936–7 and an abstract of reports of public analysts in England and Wales for the year 1936 The samples analysed numbered 146,438—the highest number on record Of 6431 samples of drugs examined 264 were found to be adulterated or not up to standard Fifteen samples of sweet spirit of nitre were reported to be deficient in amyl nitrite and deficiency in ammonia was found in a number of samples of ammoniated quinine Too much or too little boric acid was found in boric ointment, too little phenol in carbolic ointment, and too little zinc oxide in zinc ointment Deficiencies were also reported in mercurial ointments and three samples supplied in response to a request for calomel ointment were found to be calamine ointment, and in fact labelled as such Incorrect proportions of iodine or potassium iodide or of both resulted in adverse reports on some solutions of iodine Three prescriptions were found to be wrongly dispensed

R M B F Christmas Gifts

SIR —It is my privilege to appeal once more to your readers on behalf of the Christmas Gift Fund of the Royal Medical Benevolent Fund For many years it has been our endeavour to give a Christmas gift of 30s to as many of our beneficiaries as possible Through the great generosity of your readers during the last two years we have been able to give a gift of 30s to all our annuitants and regular grantees

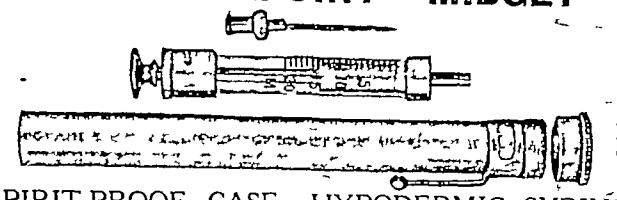
I seek your support for this appeal for the coming Christmas, and I have every confidence that the response will be as liberal and as whole hearted as in previous years All will realize what the value of this Christmas gift is to those who are living a lonely life, in great poverty and in advanced age, some bearing the afflictions of blindness, deafness, or ill health One letter of thanks received from an annuitant last year ended

"Thank you all very much indeed, and please let your subscribers know as far as you can, all that their gifts mean to us who have small incomes Tell them how much happiness they give us

Will those who have kindly helped to raise this special Christmas Gift Fund in the past help again by sending a donation to the Honorary Treasurer Royal Medical Benevolent Fund, 11, Chandos Street, Cavendish Square, London, W 1 ?—I am, etc,

THOS BARLOW
President.

October 13



Surgery of Tendons

SIR —The article by Mr Bingham and Mr Jack in the *Journal* of October 9 (p 701) on cut extensor tendons of the fingers raises several interesting points The surgery of tendons has come to the forefront of recent years, though even now at many hospitals tendon suturing is the perquisite of the recently qualified casualty officer, yet a tendon injury may give rise to a permanent deformity An insurance company for whom I do reports regards cases of sutured tendons as likely later to come for amputation, and therefore will require a sum set by for the payment of full compensation for permanent disability Recently no less an eminent authority than Mr Elmslie stated in an article that no sutured flexor tendon was ever a success yet in the first paragraph of their article Mr Bingham and Mr Jack would imply that delay is the chief factor for this gloomy outlook.

Surely, also their artistic diagram is not true to anatomical facts If the proximal interphalangeal joint of the finger be flexed fully extension of the distal joint is impossible The oblique pull of the interossei is partially counteracted by this flexion and their pull on the lateral parts of the dorsal expansion of the extensor tendon is insufficient to produce extension of the last phalanx This fact can be simply demonstrated on one s own finger by holding the first phalanx extended This was the subject of an interesting letter by Mr Fairbank in the *Journal* of May 11, 1931 (p 866) Mr Fairbank advocated the position of flexion of the proximal interphalangeal joint as being the ideal position in which the finger should be placed in avulsion of the distal end of the extensor tendon In this position the distal part of the tendon was thrown completely out of action, hence

TWENTY-FIVE per cent. of the flour from which the HOVIS TRADE MARK loaf is produced is wheat germ

Science advocates the use of germ-bread as a factor in promoting nutrition That is why HOVIS figures so prominently upon the dietary when the question of food value must be studied In white bread, the wheat-germ is practically non-existent. This vitalising source of protein, fats and phosphates abounds in HOVIS In fact, twenty-five per cent of the flour from which the HOVIS loaf is produced, is WHEAT-GERM Apart from its low starch-content, HOVIS is practically free from bran and indigestible cellulose. This factor makes HOVIS supreme for easy digestibility and assimilation

their perfectly correct action as 'a misuse of power" and this is his quaint way of describing what most men would regard as the use of reason But of more serious import than this wholly unacceptable attitude of his is the underlying fallacy that it lies within the competence of a doctor to advise and to induce abortion for exclusively social or domestic reasons (Mr Butterworth prefers the adjective 'personal'), and that the doctor has the right to decide who shall be born into the community

It is because I believe that this is the issue clearly raised by his letter that I have ventured to intervene in a topic that, on a superficial view, might not be thought to be of interest to anyone but a gynaecologist Profound ethical and sociological issues are involved in this problem, issues which the doctor has neither the legal power nor the wide and deep knowledge to solve for himself I regard it as fortunate that the State does not require him to solve it for his own proper responsibilities are surely heavy enough—I am, etc.,

London W 1 Oct 18 F M R WALSHE

SIR—It is interesting to compare Mr E A Butterworth s letter (*Journal* September 25, p 635) with that of Dr F M R Walshe (October 2, p 678) In every case induction of abortion is an illegal operation, however wrong or cruel it may be to withhold it Medical men of repute make certain arbitrary rules among themselves, varying in different localities as to the circumstances in which they should advise or perform it They trust that no judge or jury would convict if proceedings were taken against them, relying on their ability to prove that their illegal act was to prevent serious consequences to the mother There must be few general practitioners who would not agree that the health of both of Mr Butterworth s patients would be seriously affected, or be likely to be affected, if their pregnancies were allowed to proceed to full term In consequence, most of them would agree that induction of abortion was the correct treatment For the experts of the hospital to which these cases were sent to refuse their co operation and for Dr F M R Walshe to agree thereto on the grounds that with frequent ante natal supervision and possibly sanatorium treatment the woman would probably go through her confinement successfully," is, in my opinion sheer brutality

In Mr Butterworth s other case, why should it not be taken into consideration that the child would be brought up by a parent totally unfitted by her illness for the task? Would not a judge and jury also take that into consideration before giving their verdict? The Latin tag quoted by Dr Walshe does not apply All the circumstances should be considered by and have weight with the doctors since the decision rests solely with them Dr Walshe writes that Mr Butterworth 'frankly admits that on purely clinical grounds they were justified in their refusal to induce abortion This is a gross misstatement of fact Mr Butterworth merely used the adverse environment of the infant as an additional and minor argument

In contrast to Dr Walshe I would strongly advocate that the law be altered to legalize the induction of abortion in suitable cases General practitioners with their wider knowledge of the environment of women of the poorer class who are ill are often more competent than consultants to judge what the effects of pregnancy and childbirth would be I would suggest that efficient safe guards against abuse might be

1 The patient s own doctor and two others not necessarily consultants should all agree that induction of abortion is justifiable

2 Not less than a week s notice that the operation is intended should be sent to, say, the local medical officer of health, giving particulars of the grounds for justification and the names of the patient and doctors concerned

3 The medical officer of health might be empowered to require a fourth opinion in cases of doubt

Incidentally, this would tend to prevent many of the really illegal abortions, induced secretly—I am, etc,

Nottingham, Oct 6 PERCY HARDY

"The Tonic Pupil"

SIR—In the *Journal* of October 16 (*Epitome* paragraph 295) there is a reference to "Adie s syndrome Claims for priority are apt to be undignified and controversial, may I, however put forward the following facts?

In 1924 (*Transactions of the Ophthalmological Society of the United Kingdom* XLIV, 38) I published seven cases of these pupils, and suggested that they called for separate recognition and proposed the name of 'non-leutic Argyll Robertson pupil' for them In 1931 (*Transactions of the Ophthalmological Society of the United Kingdom* LI, 203) I added eight fresh cases to the number At the same meeting Gordon Holmes included some in an important group of cases he then reported Adie reported his cases in 1931 (*British Medical Journal* 1931 **1**, p 928)

In the first group of cases published seven years before Adie s I summarized the characteristics of these pupils as follows

1 The contraction with convergence and dilatation when convergence is relaxed is characteristically slow
2 They are not associated with paralysis of accommodation
3 They dilate freely with mydriatics
4 They are frequently uni ocular
5 They are unassociated with syphilis
6 The knee-jerks were present in every case
7 In no case was there evidence of parasyphilitic or any other general nervous disease even after so long as thirteen thirty-six, and forty years in three cases

In my later group, comprising fifteen cases I pointed out the preponderance in the female sex, and asked for a more appropriate title than that I had used It will be seen that all my cases were reported before Adie s communication the first group of them seven years beforehand Adie suggested the better title for them of the tonic pupil—I am, etc.,

London W 1 Oct. 18 R FOSTER MOORE.

Cataract Extraction

SIR—As most cataract operations are done on elderly people and one can get perfect anaesthesia under cocaine, why should these patients who have had months of gradually losing their sight, have the further anxiety of semi narcosis brought on by the injections of morphine, scopolamine or other drugs? In mental cases where you do not know what the patient will do as described in Dr J J Laws s letter it is necessary but the ordinary patient, if told beforehand how to look down look up, and not to squeeze his lids has no difficulty whatever in doing as the surgeon wishes since the whole operation is completed in about a couple of minutes Personally, I have never had any trouble in twenty odd years of these cases under simple cocaine anaesthesia, some of which have been done in their own homes when they could not afford nursing home fees in fact they have been much more comfortable mentally than if they had been away from their own home and in strange surroundings—I am, etc

London W 1 Oct. 18 SYDNEY TIBBLES

CALEDONIAN

How We Assist in the Purchase of Medical Practices

Scotland's Oldest Insurance Company is prepared to assist Doctors in the buying of Medical Practices or Partnerships The purchase price is repayable over a term of years, and a Life Assurance Policy is taken out as a collateral security This scheme makes it unnecessary for a Doctor to approach his friends to act as guarantors, and enables him to pay for his practice out of income After the repayment of the loan, the Life Policy becomes a valuable asset to the Doctor

Many Doctors have already established themselves in practice with the aid of the "Caledonian" Scheme The Interest Rates are particularly moderate *The Accountant's charges for investigating the practice and the Legal Fees for preparation of the deeds and documents in connection with the Loan are paid by the Company in completed cases* Arrangements can be made to meet special cases

How, then, except in census years, does the Registrar-General know the numbers of English people of different ages at any one time? Census returns count only those actually in England This must be very misleading from the point of view of mortality rates, as there are always many thousands of males between the ages of 16 and 60 out of the country—those in the Army Navy Merchant Service, Civil Service, trade etc , and emigrants, who rarely return, are mostly males This may largely explain the sudden change in the ratio of the sexes—in England—from the age of 20, and again the temporary rise in the proportion of males from about the age of 55, when the wanderers begin to return for good The fact that more men are killed accidentally is largely offset by women s monopoly of childbirth fatalities

Deaths again are registered and there seems no doubt that women have more chance than men of attaining a great age , but from about the ages of 20 to 55 I should say the proportion of male to female English people is roughly equal, with most probably a slight excess of males —I am, etc ,

Tunbridge Wells Oct 5 A Mahony-Jones

Apparatus for Continuous Suction

Sir —The defects of the Bunsen type of aspiration pump mentioned by Mr Bennett-Jones in his excellent article (September 25 p 613) are easily overcome , and, in the following form, continuous suction may be laid on to a number of beds in a ward for a very modest sum

The suction pump (a very good model is made by Messrs Allen and Hanburys at, I believe 18s 6d) should be soldered on to a cold water tap situated either in the ward or prefer ably in an adjoining room Lead gas piping, soldered at one end to the nozzle of the pump is then carried through the intervening wall if necessary along the wall of the ward at waist level Gas taps with nozzles are then soldered into the supply pipe at intervals corresponding to the number of beds it is desired to equip with suction A mercury mano-meter should be included in the lay out near to the water tap and if it is required a release valve to obviate excessive suction. In this manner half a dozen beds may be equipped for about £3 The apparatus is very reliable and presents no difficulties in upkeep If a length of strong rubber tubing (the rubber grip for a hockey stick answers very well) is pushed on to the outflow end of the pump the flow of water is rendered almost inaudible I have suggested that the supply pipe should be carried round at waist level since not only is it more convenient to operate the taps at this height but there is less chance of the lead pipe being flattened

There are several well-designed suction jars on the market, but a large jar with a wide neck and a rubber bung may be used with complete success for the collection of urine or of pus from an empyema Rubber pressure tubing must be used to connect the jar to both patient and tap

—I am, etc.,

Grappenhall Cheshire, Oct 12 Stewart Gourlay

Expulsion of Placenta in Advance of Foetus

Sir,—The recent interest in cases of premature separation of abnormally situated placentae prompts me to submit the following case

The patient a 9 para aged 36 last menstruated on July 1 1936 Dr Harloe Fleming of Willesden who had not seen the patient before was called in by the midwife on March 12 1937 there being no progress in delivery after fourteen hours labour The patient had not had ante-natal care

On vaginal examination Dr Fleming found the placenta to be partially extruded through the cervix There had been no abnormal bleeding nor did the examination evoke a haemorrhage The patient was admitted to hospital

On admission her condition was good, the uterus was the size of a thirty-eight weeks pregnancy, and the uterine con tractions were weak The presentation was right occipito posterior and the head which felt very large was not engaged in the pelvis The foetal heart was not heard On vaginal examination the placenta was found to be lying in the vagina completely separated, having passed through an almost fully dilated cervix The umbilical cord did not pulsate The placenta was removed, and on further vaginal examination it was obvious that the child was hydrocephalic

Under general anaesthesia bipolar version was performed the cervical vertebrae divided a metal catheter passed up the spinal canal and 30 oz. of cerebrospinal fluid obtained The head was then delivered without difficulty The child was a macerated hydrocephalic female with spina bifida length 23 inches weight 10 lb 10 oz.

Sulphonamide tablets were given to the patient as a prophy lactic measure in view of the manipulations and except for a slight cough and transient rise of temperature the puerperium was uneventful

The case is interesting in that the abnormally situated placenta separated from the uterus with a minimum of haemorrhage —I am, etc.,

Henry Canwarden,
London N W 10 Oct 16 M.M.S.A M C O G

Pernicious Anaemia and Diabetes Mellitus

Sir —In connexion with the association of pernicious anaemia and diabetes with achlorhydria (*Journal* Sep tember 25, p 617), the history of a family in my practice is interesting

J C a farmer died at the age of 60 from pernicious anaemia Several of his relatives had suffered from the same disease and this was so frequent that I have heard pernicious anaemia spoken of as C anaemia in the village in which he lived Of his four children one died in childhood from tuber culosis and another is in normal health A daughter died in 1919 in her early twenties from severe diabetes Another son then aged 26 was found in 1927 to have slight and inconstant glycosuria Dr Eve of Hull found his blood sugar normal and advised hydrochloric acid This he was able to take in large doses showing that he probably had achlor hydria So far there has been no change in the glycosuria A nephew (whose father died in 1914 from spinal sclerosis most likely subacute combined degeneration) after a period of general ill health was given acid. hydrochlor dil of which he has continued to take half a teaspoonful with his meals for four years with marked benefit He had begun to com plain of soreness of the tongue but this symptom disappeared soon after starting the acid

The family undoubtedly has a predisposition to achlor-hydria and pernicious anaemia, and the occurrence of a case of diabetes suggests that achlorhydria may be the fundamental factor in the association It remains to be seen whether the son with glycosuria will develop diabetes in later life —I am etc.,

CHRONIC PSORIASIS

Complete cure after local treatment with Peat Ointment.

This letter came to us from a doctor the other week

Dear Sirs

I am very pleased to report that a young married woman patient has been completely cured of a very long standing Chronic Psoriasis by the use of your Sphagnol Ointment

I consider that this is very remarkable as this patient has been under treatment for years in private and Hospital and Sphagnol is the only preparation that has brought lasting relief Her skin to day is as soft and clear as in her early childhood days Needless to say she is extremely grateful and her recovery has caused a great deal of favourable comment.

Yours very truly,
(Signed) M B Ch B F R F P S

Though neither dangerous nor painful psoriasis is still a great annoyance. Usually, correcting faults of clothing and diet will give relief but sometimes local assistance is necessary Then regular applications of Sphagnol Ointment, which contains the healing principles of peat, will generally clear up the skin in a very short time.

If you are not familiar with Sphagnol preparations, please let us send you free samples

Obituary

SIR JOHN WILLIAM MOORE, M D, D Sc LL D F R C P I

Consulting Physician Meath Hospital Dublin

Sir John William Moore died in Dublin in the early hours of Tuesday, October 12, within a few days of his ninety-second birthday A cerebral thrombosis forced him, most unwillingly, a few weeks ago to retire to his bed, and pneumonia brought his long and useful life to a peaceful close Medical tradition was strong in Moore's family, for his father, William Daniel Moore, was M D of Dublin and Cambridge, and his grandfather and great-grandfather had been apothecaries But William Daniel Moore was more than a doctor he was a man of great culture a fluent writer and an excellent linguist characteristics which his eldest son, John William Moore, inherited in full measure Students of genetics may be interested to know that Sir John's great grandfather died in his ninety seventh year

John William Moore was educated at Trinity College, Dublin Here he achieved the summit of undergraduate ambition by being elected scholar in classics in 1865 In Trinity, according to an old custom, a scholar is invited to the Trinity Monday dinner on each tenth anniversary of his election Sir John attended and made a speech at the dinner held in 1935, the seventieth anniversary of his election He graduated from Dublin University with the degrees of A B in 1865, M B and M Ch in 1868 and M D in 1871 In the latter year he received the Diploma in State Medicine, being one of the group of four on whom the diploma was first conferred by Dublin University which, first in the United Kingdom instituted such a diploma, the predecessor of the now more common D.P.H In 1870 Moore became a licentiate, and in 1873 a Fellow of the King and Queen's College of Physicians of Ireland now the Royal College of Physicians of Ireland His high reputation was acknowledged by the Royal Colleges of Physicians and Surgeons of Ireland with the honorary D P H in 1898 by the University of Oxford with the D Sc degree (*honoris causa*) in 1904 and by the National University of Ireland with the honorary degree of LL D in 1933

It is impossible to do justice within the allotted space to a man whose professional life all of which was active covered a span of nearly seventy years Certain aspects of it must however receive attention and of these none is more worthy of record than Moore's connexion with the Meath Hospital which he first entered as a student in 1865 and which he left for the last time already marked for death a few weeks ago In 1875 he was appointed physician to the hospital in succession to the great William Stokes Stokes had held the position from 1826 until 1875 Moore held it from 1875 until 1933, when he resigned and was appointed consulting physician There can be few hospitals in which two men carried on active teaching for a period of 107 years As a student he worked in the hospital which had then no isolation wards, during the cholera epidemic of 1866 in which year there were in Dublin 1,459 deaths from the disease Moore was vice president (1881–2) of the Royal College of Physicians of Ireland registrar (1882–91) and president (1898–1900) He was one of the most regular attenders at the monthly meetings of the College, and every Fellow will regret his absence from his usual seat on the President's left hand

In 1882, largely under the influence of John William Moore, the various medical societies of Dublin were merged in the Academy, now the Royal Academy, of Medicine in Ireland He was a member of its general council from 1882 until 1935 when he was made an honorary fellow, and was for many years its secretary for foreign correspondence He was for thirty years (1903–33) representative of the Royal College of Physicians of Ireland on the General Medical Council He served on the Executive Pharmacopoeia and Public Health Committees acting as chairman of the latter for twenty three years

Sir John was a fluent attractive, and voluminous writer He was author of *Text book of the Eruptive and Continued Fevers* (1892), *Meteorology Practical and Applied* (1894, second edition 1910), and joint author of *Manual of Public Health for Ireland* (1875) In addition he published a large number of papers dealing chiefly with fevers public health and meteorology in the *Dublin* (later *Irish*) *Journal of Medical Science* the *Transactions* of the Royal Academy of Medicine in Ireland and elsewhere From 1873 until 1920 he was editor of the *Dublin Journal of Medical Science*. He was a Fellow of the Royal Meteorological Society and outside his profession his chief interest was in the phenomena of weather Morning and evening for seventy years he read his barometer and thermometer and recorded the rainfall and for half a century with unfailing regularity, he contributed a daily weather report to a Dublin newspaper He received during his long life many honours In 1900 he was knighted in 1910 he was made D L for Dublin City and in 1912 he was appointed Honorary Physician in Ordinary to H M the King in Ireland In many other directions also his skill and experience received recognition He was consulting physician to several Dublin hospitals a member of the Irish Public Health Council (1919–20) and of the Council of Dublin University (1903–26) His membership of such bodies was for him no mere honour He regularly

Medical Superintendent, Dr McCLINTOCK.

pronunciation of many of our scientific words derived from the Latin As an after dinner speaker or in proposing a vote of thanks at a meeting he could always on the spur of the moment say the right thing most graciously He knew well the value of bestowing praise where it was due and many a junior felt encouraged and helped by his commendation

At the bedside of a patient he was always cheerful and his own optimistic view of life seemed to pervade the room and bring comfort and healing Of his scientific acquirements and of his knowledge of languages I will not speak, but I well remember him telling me one evening as we looked over some medical journals that he had taught himself to read the Scandinavian languages because his father had been able to do so, and he felt that it was due to him as editor of the *Dublin Journal of Medical Science* to carry on the tradition of his father and be able to read all the journals which reached him As a clinician Sir John belonged to the old school, but he was rich in wisdom and experience He was an adept of the lost art of prescription writing, and his mind was stored with therapeutic devices culled from many sources, but especially from his own early teachers Punctilious in thought and deed considerate for the feelings of others hating to inflict pain his life was gentle and take him for all in all he was a man

[The photograph reproduced is by Lafayette Dublin]

SIR ASHLEY MACKINTOSH, K C V O M D., LL D F R C P.Ed

Emeritus Profes or of Medicine Aberdeen University

Sir Ashley Mackintosh emeritus professor of medicine in the University of Aberdeen and Physician to His Majesty s Household in Scotland died in a nursing home in Aberdeen on October 14 His death will cause widespread regret to many hundreds of former students He had been in his usual health during the week before his fatal illness but after travelling from Edinburgh he arrived in Aberdeen feeling unwell and pneumonia developed

Ashley Watson Mackintosh was born at Deskford Banffshire in 1868, his father being the minister of that place After early education at Milne s Institution Fochabers he proceeded to take an arts course at Aberdeen University, where he graduated M.A. with double first-class honours in 1888 He then studied for a time at King s College, Cambridge where he gained the Fullerton mathematical scholarship Deciding to study medicine he graduated M B C M.Aberd with highest honours in 1893 and took the M D degree again with highest honours in 1896 After graduation in medicine he was appointed to the George Thompson travelling fellowship and continued his medical studies at Leipzig and Vienna subsequently engaging in a course of study in London where he was clinical assistant at the National Hospital for Paralysis at Queen Square and paid particular attention to diseases of the nervous system a subject in which he afterwards specialized Among his other academic distinctions he was Murray Scholar in 1893 and was awarded the Struthers medal and prize in anatomy in 1895

Settling in general practice at Aberdeen Ashley Mackintosh decided after some eight years to devote himself to work as a consultant He had been appointed assistant physician to the Royal Infirmary of Aberdeen in 1897 and in 1909 he became one of the physicians and lecturers in clinical medicine He threw himself into the work of teaching with great energy and zest and it is evidence of his success as a teacher that when he applied for the professorship of medicine he was supported by a collective testimonial signed by 370 of his former pupils in the medical profession all over the world In 1912 he was appointed by the Crown to succeed the late Professor David W Finlay as professor of medicine in the University of Aberdeen and in 1928 he was appointed honorary physician to His Majesty s Household in Scotland In 1916 he became a Fellow of the Royal College of Physicians of Edinburgh During the war he served as lieutenant-colonel in the First Scottish General Hospital at Aberdeen He was highly popular with his medical colleagues, and was chosen as the assessor from the General Council of Aberdeen University on the University Court. He also represented Aberdeen University on the General Medical Council from 1924 to 1931 He resigned the chair of medicine in 1930 when the University of Aberdeen took the occasion to confer upon him the degree of LL D., and he was knighted in the following year In 1932 Sir Ashley Mackintosh was presented at a meeting of friends patients and colleagues with his portrait and a gift of £1 000 in recognition of his eminent services to the University and the medical profession It was characteristic of him that he handed over the portrait to the University and allocated the £1 000 for the assistance of students of the University in times of sickness

Sir Ashley Mackintosh was a frequent contributor to medical journals especially on subjects connected with diseases of the nervous system These contributions included Meninges of the Cerebrum in the *Encyclopaedia Medica* Three Cases of New Growth with Cavity Formation in the Spinal Cord *Brain* 1896 Modes of Onset and Frequency of Certain Signs in Disseminated Sclerosis" *Review of Neurology and Psychiatry* 1903 and 1906 and "Two Cases of Adams Stokes Syndrome in *Heart* 1911 He joined the British Medical Association in 1896 acted as representative in 1904 at the Annual Meeting at Oxford and was chairman of the Aberdeen Division in 1928–9 He was honorary secretary of the Section of Medicine in 1904 vice president of the Section of Neurology and Psychological Medicine in 1913 vice-president of the Section of Medicine in 1914 and again at the Centenary Meeting and president of the Section of Neurology and Psychiatry in 1921

In his teaching work he took a deep interest not only in the instruction but in the personalities of his students and in matters where their interests were concerned no trouble was too great for him to undertake while he managed to keep in touch with great numbers of them long after they had left the University Together with the late Professor Matthew Hay he was one of the chief guiding spirits in the initiation of the new hospital scheme which is proceeding towards completion at Forresterhill. The inherent sympathy and charity of his character were universally recognized

Dr Edwin Bramwell writes

The news of Ashley Mackintosh s death from pneumonia must have come as a shock to his many friends A few days previously he had attended a dinner and was in the best of form regaling those present with some of his inimitable anecdotes of former days told in the rich Doric

PISTANY SPA MUD

for HOME and HOSPITAL TREATMENT of persistent RHEUMATIC disorders

Different from ordinary heat therapy

Why? Simultaneously with the physiological responses of the body to heat, reactions are caused specifically by this hot sulphurous, radio-active "living mud A detailed account of the analytical, biological and clinical evidence appears in the September "British Journal of Physical Medicine."

How? It is easy and clean to apply The hot mud is wrapped in "Cellophane" in which a window is cut to expose the mud surface to be laid on the skin This method entirely meets the conditions prevailing in clinics or homes, and costs very little to apply For demonstration phone LANgham 4214

FULL INFORMATION FROM

PISTANY AGENCY LTD, 310, Regent Street, London, W 1

Please state when enquiring whether introducing treatment personally or prescribing treatment for patients

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

317 Epidemic Gastro intestinal Intoxications

O L VON CANON (*Arch Pediat* June 1937 p 360) records his observations on an outbreak which has occurred for several years in more than 50 per cent. of infants and young children in paediatric practice at Chattanooga, Tennessee, in March and April The causative agent is not known but there is evidence that it is a contagious infection which does not appear to have any relation to influenza A large number recover in a few days, while a few develop watery diarrhoea which lasts a week or longer The temperature is variable, but rarely high

318 Lipoid Nephrosis

L VILLA (*Rass Fisiopat clin terap* May, 1937, p 257) puts forward as deserving investigation the suggestion that diencephalo pituitary modifications may be aetiological factors in lipoid nephrosis He is sure, however, that in many cases of this disease there has been an antecedent glomerulonephritis The presence of a thyroid hypofunction in lipoid nephrosis has previously been noted and the fact that the thyroid is subordinate to the anterior pituitary is now established Barbaro-Forelo in Villa's clinic has detected by means of *x* rays structural alterations in the cranial base—namely, sphenoidal sinusitis and perisinusitis with affection of the sella turcica—in two cases of lipoid dystrophy and Ferro Luizzi and Romeo noted retarded development and hypogenitalism in certain cases Villa now describes two cases which support his view In the first a liponephrotic syndrome with opalescent serous effusions, anisotropic lipoiduria normal blood urea, moderate hyperlipaemia, and reduction of serum albumin, although certainly following an acute nephritis, was associated with retardation of growth and with sellar and other radiological signs suggesting oedema near the third ventricle The second and more suggestive case was that of a woman, aged 52, in whom the syndrome of Simmonds's hypophyseal cachexia, including premature senility, wasting and the falling out of the hair and teeth, coexisted with mild signs of diabetes insipidus, lipoid nephroses, and radiological indications of an interclinoid bridge, laminal osteophytes, and opacities in the sella turcica Notable clinical improvement followed the administration of pituitary extracts and later the temporary grafting of the whole gland

319 Alcohol Injections in Artificial Pneumothorax

S GUNELLA (*Ri Patol Clin Tuberc* July, 1937, p 485) in a preliminary note suggests alcoholization of the visceral pleura in certain cases of ineffective pneumothorax as being less dangerous than intrapleural injections of tincture of iodine oil irritants or serum He believes that the beneficial effect of the injections is not due to their weight or volume, nor to their causing effusions but primarily to quickly occurring neuro functional reflexes in the bronchopulmonary smooth muscle Alcohol in small amounts was found to cause no febrile reaction and in eleven cases out of twelve no effusion and it was quickly absorbed usually without toxic effects His patients in spite of treatment by total or subtotal pneumothorax showed a persistence of cavities from rigidity or adhesions phrenic evulsion or thoracoplasty had either proved unsuccessful or had been judged inadvisable The results were satisfactory provided that it was possible to inject alcohol in a concentration of 33 per cent Sometimes this was not feasible for although the pain following the injections was usually supported without difficulty it was occasionally severe The injections were given with the patient lying down with the head raised Refills were carried out as usual, and alcohol injections were repeated at intervals of from fifteen to thirty days in amounts of about 30 to 40 c cm of a 33 per cent solution

320 Arteriosclerosis of the Pulmonary Artery

E TRIZZINO (*Arch ital Anat Istol patol* November, 1936, p 452) distinguishes between primary and secondary arteriosclerosis of the pulmonary artery The former is much rarer, and may be localized or part of a generalized arteriosclerosis, in which case it is very commonly syphilitic The latter is sometimes secondary to pleural adhesions, emphysema, or pulmonary fibrosis, it is often found with congenital heart disease, and it is very often present in acquired heart disease, especially mitral stenosis Chronic adhesive pericarditis is a less common cause, a case is described of advanced intimal disease in the pulmonary artery and its branches in a man, aged 46, who died from chronic adhesive pericarditis He had had much oedema of the face and arms, but apparently not marked cyanosis In such cases as also when mitral stenosis is accompanied by arteriosclerosis of the pulmonary artery, a congenital weakness of the wall is probably present and accounts for this exceptional condition

Surgery

321 Renal Radiography at Operation

The kidney has been examined radiographically at operation in a few hospitals for some years H HEUSSER (*Schweiz med Wschr*, July 10, 1937 p 630) adds his recommendation to that of others The procedure not only gives more reliable pictures than does ordinary radiography, but it permits the recognition of small fragments and mud" Heusser has contented himself with examination of films, and sees no further advantage in darkroom inspection He makes as many as three or four successive films in some operations, suspending the luxated kidney in Pflaumer's mat and using special sterilizable purse bags for the films He has also found it possible and technically simple to use *x* rays for making pyelograms of the kidney at operation, the contrast medium being introduced into the renal pelvis by puncture or through a catheter inserted through the bladder before and into the ureter during operation or introduced through the ureteral incision This investigation is specially useful in cases in which impermeability of the ureter or unilateral renal non function makes excretion urography or retrograde pyelography impossible it is also of assistance in planning operations for renal tuberculosis or tumour, or plastic operations Excretion pyelograms of the freed kidney have been made after intravenous injections of perabrodil in animals but apparently not in man.

322 Tumours of the Renal Capsule

According to E WACHS (*Beitr klin Chir*, July 28 1937, p 1) tumours of the renal capsule are much more common in females and they arise in the fibrous or fatty capsule or both or as mixed tumours of uncertain origin They may attain a large size—Waldeyer described a myxoliposarcoma weighing 31 5 kg.—and although metastasis is rare recurrence after operative removal seems to have been reported in every case Histologically they are sarcomata usually of the spindle-cell variety Wachs describes a fibrosarcoma of the fibrous capsule weighing 7 kg, and showing extensive necroses and cystic degenera-

Post-Graduate Teaching, West London Hospital.

Copies of the regulations for entry of conditions of Service including rates of pay and allowances, may be obtained from the *Medical Director* General of the Navy Admiralty S W 1 and from *the Deans of Dental Schools*

Applications for entry in January 1938 must be received not later than December 1st 1937 and for entry in April 1938 not later than March 7th 1938

HIS MAJESTY'S COLONIAL SERVICE.

COLONIAL MEDICAL SERVICE.

A vacancy exists in Trinidad for a MEDICAL OFFICER OF HEALTH (Venereal Diseases Service)

Qualifications—Candidates must be British subjects and possess a medical qualification registrable in the United Kingdom They must hold the Diploma of Public Health and have had special experience in the treatment and administration of venereal diseases

Duties—Attendance at Venereal Diseases *Clinics* and the treatment and administration of venereal diseases propaganda and *educational* work in districts when required and such other public *health duties* as may be prescribed by the Director of Medical Services The officer appointed may be required to serve in any district in the Colony

Salary—£600 a year rising by £25 to £800

Terms of Appointment—The appointment is pensionable, but the officer will be on probation for two years Private practice will not be allowed

Quarters—A housing allowance of £100 a year is payable.

Passages—The selected candidate, who will be required to proceed to Trinidad as soon as possible, will be provided with free first-class ocean passages for himself and his family not exceeding five persons in all on first appointment. Leave passages are not provided Further particulars and forms of application may be obtained from the DIRECTOR OF RECRUITMENT (Colonial Service) 2 Richmond Terrace Whitehall London S W 1

coagulation took twelve minutes and bleeding lasted for 2 minutes 20 seconds As the condition did not yield to ordinary treatment 30 c cm of the whole blood of the patient s niece, who was convalescing from an attack of acute articular rheumatism was injected intragluteally, and rapid improvement occurred A second injection was given two days later, and the acute articular condition cleared up completely

Neurology

328 Toxic Hydrocephalus

D Macalpine (*Brain* July, 1937, p 180) has reported five cases in which there was clinical evidence of a marked increase of cerebrospinal fluid pressure in the absence of a cerebral tumour The cases were similar to those described by Symonds as "otitic hydrocephalus, but the author points out that an aural infection is not of necessity the precursor of the hydrocephalus The patients were between the ages of 11 and 18, and the precipitating causes were sore throat, acute nasal catarrh, or nasal sinus infection There was a rapid onset of symptoms of intracranial hypertension such as headache and vomiting, with a rapidly increasing papilloedema causing unduly severe visual deterioration There was almost a complete absence of general constitutional disturbance or of evidence of any abnormality in the central nervous system, the only signs being those due to pressure on the optic nerve head and to extra ocular palsies Except for an increase in pressure which was 300 mm of water or over, there was no abnormality in the cerebrospinal fluid Treatment by removal of the toxic focus and daily lumbar puncture produced excellent results, with slight visual impairment as the only residual sign These cases are pathologically similar to those of arachnoiditis of the posterior fossa and are of the heterogeneous group which used to be called serous meningitis The diagnosis from arachnoiditis or posterior fossa tumour with internal hydrocephalus can only be made with certainty by ventriculography It is probable that the condition is due to a reaction to streptococcal infections

329 Chronic Inflammation of Intervertebral Ganglia

H Harttung (*Zbl Chir*, August 7 1937, p 1878) describes a case in which a chronic inflammatory condition of a spinal ganglion was accompanied by swellings which spread towards the roots and the spinal nerves The condition was diagnosed as an extradural tumour and the patient was submitted for operation The author summarizes the clinical manifestations of the lesion and explains why there were neither sensory nor motor disturbances either before or after the operation Complete recovery which has been maintained for more than ten years resulted

330 Electro encephalograms in Epilepsy

F Golla S Graham and W Grey Walter (*J ment Sci* March 1937 p 137) have investigated the electrical potential changes in the cerebral cortex of subjects suffering from epileptic attacks Berger showed in 1929 that these changes could be detected through the intact skull by means of electrodes placed on the scalp Grey Walter has previously described his technique which involves the use of three amplifying circuits with recordings from a cathode ray oscillograph He has also shown that rhythmic electrical changes of relatively high potential occur in relation to an abnormal cortex such as that involved by a neoplasm It has also been shown that these slow waves occur when the cortex is inhibited as in ether or nitrous oxide anaesthesia A series of 214 epileptic patients were examined in the Hospital for Nervous Diseases, Maida Vale and in the Maudsley Hospital It was found that these cases could be divided into two large groups the first of which comprised those having minor fits, which were not necessarily idiopathic, and the second those suffering from major fits which because of the family history, age of onset, and type of attack had been called idiopathic A large number of this second group had areas of abnormal potential change in the cerebral cortex when the patients were resting quietly and no fits were occurring In some slow changes in potential occurred all over the cortex, in about half there were two discrete foci at symmetrical points on each hemisphere, and in the rest the foci were present in the right or the left hemisphere It was found that these waves of potential change, which had a biphasic rhythm of about three a second, occurred exclusively in so called idiopathic epilepsy, and were not found in patients suffering from symptomatic epileptic attacks, and that they were never present in normal subjects Similar but much more regular waves were observed in pyknoleptics When a fit took place during examination the very large accompanying electrical discharge began in the area of abnormal potential change which had been previously recognized in that case It is interesting that the majority of the frontal foci of discharge were observed to begin in area 6α β of Vogt The work is continuing and further interesting results have been obtained

331 Reflexes in the Newborn

R A Lyon (*Schweiz med Wschr* July 24, 1937, p 689) describes the positive reflex reactions elicited in 100 normal babies within the first twenty-four hours of life The patellar reflex was present in 98 per cent of cases and the weight of the child did not appear to influence the force of the reaction The Achilles tendon reflex and that of the biceps and olecranon were present in 42, 89, and 63 per cent respectively of cases in which complete muscular relaxation could be obtained Ankle clonus was found in only one baby No relation between the positive reactions of these reflexes and the degree of nutrition and development of the babies was ascertained Babinski s plantar reflex was of such variable occurrence that no significance could be attached to it Closure of the hand on pressure of the palm and flexion of the toes on pressure of the sole occurred in all babies and the sucking reflex was also present Gentle scratching of the skin with a sharp instrument produced a vasomotor reflex in 90 per cent of cases but Oppenheim s reflex was absent in all but 6 per cent The abdominal and cremasteric reflexes were absent in all babies when awake but they could sometimes be elicited during sleep A semicircular movement of the arms with extended fingers on changing the baby s position Moro s reflex and Chvostek s facial reflex were present in nearly all cases The reaction of the pupils to light was variable and completely absent in 10 per cent Lyon states that the absence of a positive reaction in the case of the patellar sucking facial bicipital and Moro s reflex as well as closure of the hand and flexion of the toes on pressure of the palm and sole denotes a lesion of the peripheral nerves intracranial haemorrhage or an arrested mental development in the newborn Chvostek s reflex is not an indication of spasmophilia provided that no other signs accompany it

332 Mass Reflexe with Autonomic Bladder Action

O R Langworthy (*Johns Hopk Hosp Bull* May 1937, p 337) has described a case of spinal injury in which a mass reflex of the lower limbs was associated with micturition The reflex is an example of that described by Denny Brown and Robertson in 1933 Langworthy s case was of a young woman who had sustained an injury of the lower lumbar cord reflex micturition became established Micturition produced flexion and adduction of the toes and extension and internal rotation of the leg This was associated with a cramp-like pain in the urethra and the contracted muscles Holding the toes extended postponed micturition and voiding could be induced by

URBAN DISTRICT OF CHADDERTON

Appointment of MEDICAL OFFICER OF HEALTH SCHOOL MEDICAL OFFICER AND CHILD WELFARE OFFICER

The Urban District Council of Chadderton invite applications from gentlemen for the appointment of Medical Officer of Health School Medical Officer and Child Welfare Officer Every candidate must be a duly qualified medical practitioner not exceed ing 45 years of age and must be registered in the Medical Register as the holder of a diploma in sanitary science public health or state medicine

First cure the constipation . . .

The dangers of constipation are doubtless occasionally overstressed, but they are far more often under-estimated Opinions based on centuries of experience are rarely without foundation, even though the rationalised explanations offered turn out to be fallacious It was almost habitual with doctors, during what we may call the empiric ages of medicine, when dealing with almost every form of illness, to ensure, first of all, that the bowels were acting regularly and adequately

"First cure the constipation" is among the classic medical aphorisms that live It is common experience that a very large proportion of so-called minor illness is associated with some degree of eliminatory sluggishness When this is remedied, we are often surprised at the speedy disappearance of unpleasant symptoms seemingly remote from the constipation

The harm that may be caused by the drastic purges and the irritant aperient drugs favoured by last century practitioners is now generally recognised What is desired is a preparation that will gently promote peristalsis by the same agency as that which, in health, naturally operates It is suggested that ENO fulfils this requirement It is a carefully compounded mixture of fruit-acids with alkalis It has no ingredient irritative to the nerve-endings of the intestinal lining, its action being due entirely to its capacity for retaining fluid within the alimentary canal, through the principle of osmosis The slightly increased tension thus caused is both painless and harmless, being, in fact, the natural provocant of intestinal activity

ENO's Fruit Salt consists of fine granules which when dropped into a glass of water dissolve instantly and uniformly with sparkling and refreshing effervescence

ENO'S 'FRUIT SALT'

The Words Eno and 'Fruit Salt' are registered trademarks

CITY OF EXETER

DEPUTY MEDICAL OFFICER OF HEALTH AND ASSISTANT TUBERCULOSIS OFFICER

ANTERIOR POSTERIOR PRESS

FOR THE MOST SATISFACTORY

SUPPORT

Effective support whether for the treatment of visceroptosis by the anterior or posterior pressure given by the Curtis Abdominal Support No. 1. This is but one of the 100 abdominal appliances made by Curtis, yet each affords permanent support where it is most needed. Yet it is extremely light in weight and very comfortable to wear, giving perfect freedom to the body. Authorities throughout the world agree that the Curtis Abdominal Support No. 1 and pregnancy belt is the only where support upward and backwards of the lower abdomen is essential.

WHY AGAROL BRAND COMPOUND FOR CONSTIPATION ?

Among the curative measures advocated for overcoming constipation, none has proved more consistently successful than AGAROL — the original emulsion of mineral oil and agar-agar with phenolphthalein.

Agarol renders the fæcal mass plastic and pliable with unabsorbable moisture It lubricates the intestinal tract and gently stimulates peristalsis, ensuring an easy and complete evacuation.

Used over a reasonable period, Agarol gradually restores muscular tone and functional activity of the bowel, with the gratifying assurance that natural evacuation will follow without the need for further medication.

Supplied in 4½ *oz* 7½ *oz and* 17 *oz bottles*

Agarol is not advertised to the public.

"The Vitamin B_1 activity is assured

by biological assay of *every day's output*"

So far as is known, there is only one food product for which such a claim, involving no fewer than 250 biological assays for Vitamin B_1 per annum, is or can be made

"*Unselected yeasts may vary tenfold in their Vitamin B content*"—(*J Nutrition*, 3, 257)

"*Unselected wheat germs may vary fivefold in their Vitamin B_1 content*"—(*J Hygiene*, 37, 303)

Consequently statements as to the Vitamin B_1 potency of foods, etc, are unacceptable for therapeutic purposes unless supported by (1) an assay of each lot manufactured (2) a guarantee that the potency will not diminish with the passage of time

How then can the physician make sure that his patient receives, *in a natural form*, any desired amount of Vitamin B?
Only by prescribing Bemax

BEMAX

a unique natural source of accessory nutritional factors

Vitamin B_1 — 400 International Units per ounce.
Vitamin B_2 — Flavin present
Vitamin B_6 — (Anti-dermatitis). One of the richest sources

Vitamin A—280 International Units (as Carotene)
Vitamin E—the richest natural source,
Phosphorus—330 mg per ounce,
Magnesium—99 mg per ounce,
Iron—3 mg per ounce, and Copper =0.45 mg per ounce

Clinical sample and literature on application to
THE BEMAX LABORATORIES (Dept B 47), UPPER MALL, LONDON, W 6

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in January, 1938

Candidates below the age of 28 years are preferred and they must be registered under the Medical Acts No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1 000 (less Income Tax)

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post Graduate study

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, may be obtained from the Medical Director General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than November 22nd, 1937

APPENDICITIS A Clinical Study

By W. H. BOWEN 2 diagrams 7s 6d net

This monograph examines the whole course of the disease from diagnosis, through treatment and the various complications that may precede or follow operation, to the final cure. The etiology and prognosis of the disease are discussed with full reference to the recent controversial literature of the subject, and the analysis of the forms of the disease and their treatment is based on clinical experience running into many years and in particular on detailed records of 250 cases.

To relieve

PROSTATE GLAND TROUBLE

in ELDERLY PEOPLE

It has long been recognised by the Medical Profession that applications of small continuous electrical currents frequently give relief in the distressing cases of too frequent micturition, regarding which they are consulted by patients of advancing age.

The small apparatus illustrated is convenient for use by such patients under the direction of their Medical adviser if in his opinion operation is inadvisable. The current provided by a small number of dry cells is conveyed through suitable convenient electrodes to the parts affected. Shock or accidental excess of current is absolutely impossible. The first cost and maintenance of the apparatus is very moderate.

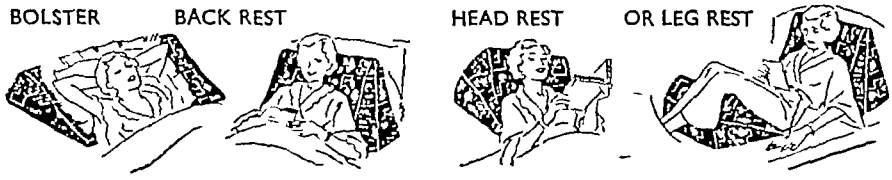
A BOLSTER *that becomes an Invalid Bed Cushion in a second!*



The Dunlopillo Adjustable Bed Cushion is invaluable to invalids and convalescents In a second it can be converted from a bolster to a back rest, head rest or leg rest, providing an ideal support. It avoids using extra pillows which are not really comfortable and enables the patient to recline or sit up in bed in luxurious comfort. The soft resilience of the Dunlopillo Bed Cushion never needs punching up it always keeps its shape It is porous self ventilating, moth proof, dustless and completely hygienic.

HOUSE SURGEON required for a period of six months Salary at the rate of £175 p.a. with board residence and laundry Applications, stating age, experience and qualifications together with copies of three recent testimonials, must be forwarded to the undersigned. H J CLOUT
General Superintendent

FORMULA

Thyminic Acid	0 10
Hexamethylenetetramine Anhydromethylenecitrate	0 50
Hexamethylene Tetramine	2 50
Piperazine Tartrate	0 25
Lithium Carbonate	1 00
Sodium Benzoate	1 00
Effervescent Base	ad 100

DIRECTIONS

One teaspoonful to be taken morning and night in a tumblerful of water

Uralysol, in addition to being a solvent and eliminator of pathological Uric Acid, is a powerful urinary antiseptic.

Normally there exists in the body a certain quantity of uric acid which assists general metabolism and after it has played its part is eliminated together with the normal thyminic acid of the organism When however uric acid is present in excess, the body needs additional thyminic acid to supplement the resultant deficit of this normal solvent of uric acid

Uralysol, by its thyminic acid content, supplies the agent necessary to dissolve excessive uric acid

The next step is the elimination of this thyminic uric acid which, being in excess of normal, necessitates treatment by an agent capable of enhancing elimination

Uralysol, by its content of hexamethylenetetramine and lysidin, stimulates the organism to eliminate the pathological uric acid already dissolved by its thyminic acid content.

MULTIVITE

(Vitamins A 'B' C and D)

The administration of Multivite compensates for the general all-round vitamin deficiency which prevails in the modern dietary, conditions of lowered resistance, lack of vitality and subnormal health which are manifestations of this deficiency quickly yield to treatment with this composite vitamin preparation, as the following reports testify

'while taking Multivite Pellets my patient is more active in his mental and bodily functions, constipation is relieved, and acne, which was severe, is much improved I am so impressed with these results that I would be glad to try the effect on myself—recovering from a most prostrating attack of influenza' —M D

'I think there are definite signs of increased vitality and a steady disappearance of night sweats in the case of pulmonary fibrosis that was having Multivite Pellets I have advised her to continue them over a long period, as I have a high regard for their value' ——— M B Ch B

Proved efficiency with *pleasantness*

In spite of its high germicidal efficiency (Rideal-Walker 3 0) 'Dettol' can be used at strengths impracticable with carbolic and cresylic antiseptics It is non-poisonous, non-staining, pleasant smelling It has been shown that when 30% 'Dettol' is rubbed into the hands and allowed to dry the skin remains insusceptible to infection by haemolytic streptococci for at least two hours, unless grossly contaminated 'Dettol' is also stable in the presence of blood, pus, faeces and other organic matter

Obtainable from chemists in 1/-, 1/9 and 3/- bottles, and in larger sizes for medical and hospital use These prices do not apply in the Irish Free State and Overseas Samples and full information on request

RECKITT AND SONS LTD (PHARMACEUTICAL DEPT) HULL LONDON 40 BEDFORD SQUARE, W C I

Towards national health —

"National Health cannot be attained or maintained without food that is adequate both in quantity and in quality."

(Annual Report of the Ministry of Health 1936-1937 p 49)

The imperative need for the nation to choose its foods wisely is a theme which is attracting considerable attention, and in this connection emphasis is placed on the importance of vitamin-containing foodstuffs

Members of the medical profession appreciate the dietetic value of Marmite—the yeast extract rich in vitamin B_1 and B_2 complex

Marmite is prescribed extensively with beneficial results in preventive and curative medicine, it is ordered particularly when vitamin B therapy is indicated and in certain forms of anaemia

ERGOAPIOL (SMITH)

AMENORRHEA - DYSMENORRHEA
MENORRHAGIA - MENOPAUSE

Today, as for years, Ergoapiol (Smith) is the accepted medicament in combating those menstrual anomalies which may be traced to constitutional disturbances, atonicity of the reproductive organs, inflammatory conditions of the uterus or its appendages, mental emotion or exposure to the elements

The physician readily can ascertain whether his prescription for Ergoapiol (Smith) has been correctly filled by dividing the capsule at the seam, thus revealing the initials M H S embossed on the *inner* surface, as shown in photographic enlargement

ALASIL

Better Salicylate Therapy

WHATEVER be the season of the year there is a wide sphere of utility for Alasil, the improved form of salicylate medication

Alasil' is a very definite advance on ordinary compounds of salicylic or acetyl salicylic acid both in therapeutic efficiency and in freedom from the risk of unpleasant gastro intestinal sequelae This high tolerability is due to the fact that Alasil' is composed of calcium acetyl-salicylate—the least irritating of the salicylate compounds—and 'Alocol' (Colloidal Hydroxide of Aluminium), a powerful gastric sedative and antacid

A careful series of experimental tests has shown that 'Alasil" is more completely absorbed than ordinary salicylate compounds and that it is practically free from the risk of liberating free salicylic acid in the stomach

Wide clinical experience anticipated these findings by demonstrating that 'Alasil' can be pushed or prolonged to a much greater extent than ordinary salicylate compounds and that it can be given with safety to children adults the aged and patients with finely balanced digestive capacities An analgesic, antipyretic and sedative of established value

A supply for clinical trial with full descriptive literature sent free on request

ALOCOL"

Colloidal Hydroxide of Aluminium

Improved Antacid Therapy

SODIUM BICARBONATE, bismuth salts and other time-honoured antacids having each proved to possess individual disadvantages, an agent such as "Alocol" which combines the best therapeutic features of these with intrinsic merits of its own, must be of interest to the physician

Alocol is a powerful antacid agent which forms with the stomach contents a colloidal jelly with the power of adsorbing free hydrochloric acid, thus fixing it and eliminating it from the system. It has a remarkably soothing effect on the inflamed or irritated gastric mucosa and is, therefore rapidly effective in relieving pain Being non absorbable "Alocol is free from any risk of alkalosis'

Alocol can be prescribed *with confidence* in all cases where alkaline therapy is indicated Issued in tablet and powder form.

Complete chemical history of Alocol with convincing clinical reports and supply for trial sent free to physicians on request

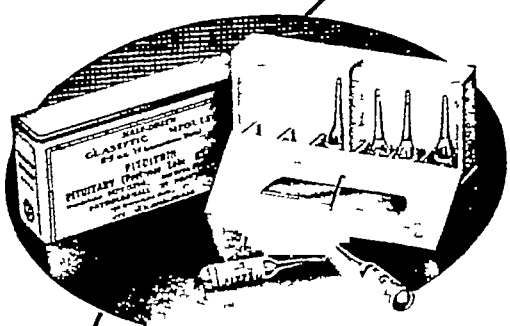
Pituitary Products



'PITUITRIN'—the first posterior-pituitary extract to be placed at the disposal of the medical profession—was introduced in 1908 and is still the premier product of its class

Parke, Davis & Co.'s experience in this connection is unique and enables them to offer preparations that are unsurpassed for uniformity of strength, reliability of action and freedom from excess proteins

Parke, Davis & Co.'s research workers showed in 1927 that there are at least two active principles in 'Pituitrin.' These are now available in 'Pitocin' (the oxytocic principle), and 'Pitressin' (the pressor and antidiuretic principle)

'PITUITRIN' is standardized to contain 10 International units of oxytocic activity per c.c., it is standardized, also, to contain 10 pressor units per c.c.

'PITRESSIN' is standardized to contain 20 pressor units per c.c. It is indicated for controlling the polyuria of diabetes insipidus, for the relief of post-operative intestinal stasis, and for the prevention of post-operative shock and collapse. It has also proved of great service in the elimination of gas-shadows in abdominal radiography.

'PITOCIN' is standardized to contain 10 International units of oxytocic activity per c.c., it is indicated as a stimulant to the uterus in labour when the uterine contractions are inadequate, especially when an increase in blood-pressure is undesirable, as in eclampsia.

PROSTATIC ENLARGEMENT

& URINARY DISORDERS OF PROSTATIC ORIGIN

Urinary retention is due in the first place to the enlargement of the gland but both the congestive and spasmodic factors must be taken into consideration as they in themselves can cause as much obstruction as the simple enlargement

The progress of adenomatous enlargement is slow yet the symptoms of urinary disorder frequency difficulty and retention show no constant relationship between the increase in the size of the gland and the phenomena of retention

SEDOPROSTYL is a preparation which embraces all three causes of obstruction and the many excellent results now placed to the credit of SEDOPROSTYL have simply repaid the work of those Urologists who devised the formula

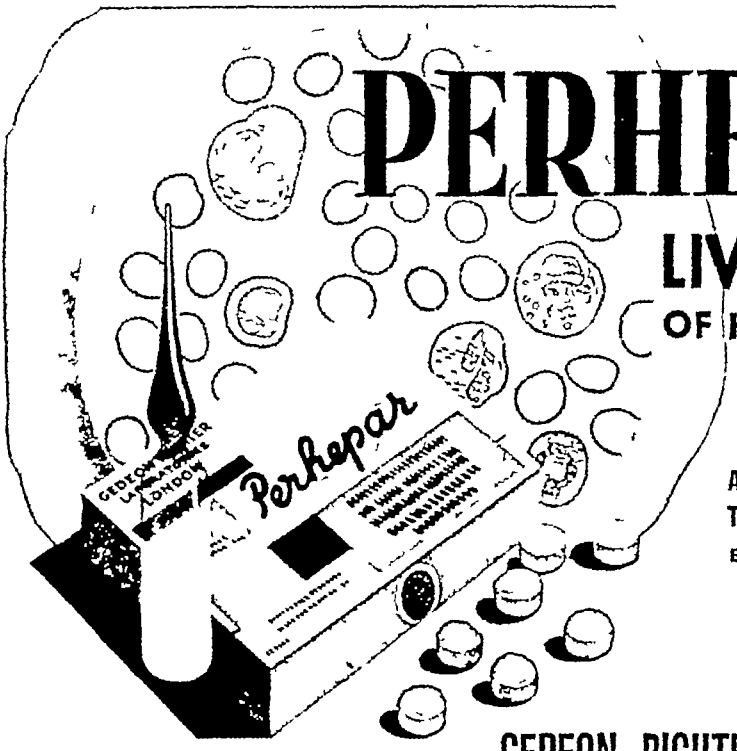
and the invading organisms were defeated Vaccine therapy, the undoubted success of which in staphylococcal lesions led to its less successful employment as a therapeutic measure in many other conditions, was based on, and apparently confirmed the belief in, opsonins

In view of our present knowledge of the importance of the exotoxins of the staphylococci, it is curious how early demonstrations of the pathogenic action of these toxins as found in broth culture filtrates by von Lingelsheim (1899) and Neisser and Wechsberg (1901) were either forgotten or neglected The more complete work of Kraus and Pribram (1906), demonstrating the presence in broth-culture filtrates of a toxin which, injected intravenously, killed rabbits in less than thirty minutes, and which could be neutralized by an antitoxin, did not until long afterwards attract the attention it merited Even the publication of similar results and the demonstration of the production of necrosis following subcutaneous injection of the toxin by Nicolle and Césari (1914) was overlooked for more than ten years, but possibly the time of publication was not propitious for the appreciation of the importance of such work

Milestones on the Road to Knowledge



The great war did not directly stimulate research on staphylococci, but indirectly it had an important effect, as it led to the discovery of a number of new exotoxins such as those of *B welchii Vibrion septique*, and *B oedematiens* The realization that there were other exotoxins, in addition to those of *B diphtheriae*, *B tetani* and *B botulinus* encouraged bacteriologists to engage in a reinvestigation of bacteria formerly believed to be endotoxigenic rather than exotoxigenic Among such investigations were those of the Dicks into the mode of action of the streptococci of scarlet fever These were facilitated by the employment of a comparatively new technique, that of intradermal inoculation, which had proved so useful in the study of diphtheria toxin by Schick It is probable that Parker investigated staphylococci afresh largely as a result of the demonstration by the Dicks of the production by a coccus of an exotoxin Whether or no this was her stimulus, despite the fact that the production of necrosis by filtrates of staphylococcal broth had been described ten years previously by Nicolle and Césari (1914) and despite the fact that she almost missed the rapid killing action of the toxin on rabbits, her first paper (Parker, 1924) must be regarded as by far the most important milestone on the road which leads from the old to the new knowledge of staphylococci Her next paper (Parker, Hopkins, and Gunther, 1926) was possibly even more important, as it first described the application of the method of Cohen and Fleming (1918)—in which cultures are incubated in an atmosphere containing an excess (10 per cent) of carbon dioxide—to broth cultures of staphylococci intended for the preparation of toxin

I hope that it is not vanity which leads me to describe as the next milestone my own contribution published in a paper by Bigger, Boland, and O Meara (1927) This was the discovery that much more active toxin could be prepared by growing staphylococci on the surface of agar than in broth This was merely a rediscovery, and the credit should go to Oppenheimer (1911), who first described the method rather than to us We were chiefly interested in the product as haemolysin, although we recorded its toxicity which led to the death of five out of the six rabbits we had attempted to immunize with it For the moment Parker and we were apparently working on quite different lines

The next milestone was not a laboratory discovery but a most unfortunate disaster In 1928, in Bundaberg, a number of children were injected with a diphtheria prophylactic which did not contain any antiseptic Staphylococci had been introduced into the bottle by some accident and had grown in the fluid Twelve of the inoculated children died, some within such a short period as to suggest a toxaemia rather than an infection Burnet was one of those who investigated the matter, and in his first paper (Burnet, 1929) he described the threefold action of filtrates of broth cultures of staphylococci grown, as suggested by Parker, in atmospheres containing 10 per cent of carbon dioxide the rapid killing effect of Kraus and Pribram following intravenous inoculation, the skin necrosis effect of Parker following intradermal inoculation, and the lytic effect on red blood cells In subsequent work Burnet (1930) used excess carbon dioxide in the atmosphere and agar, so combining the methods of Parker, Oppenheimer, and Bigger, Boland, and O Meara He used soft (1 or 0 8 per cent) agar, which after culture had taken place was minced and the fluid containing the toxin expressed and filtered In this paper he discussed the function of the carbon dioxide, and concluded that it acted as a buffer Bigger (1933) showed that by a combination of a fermentable carbohydrate and phosphate buffer in the medium the *p*H during culture could be kept at the correct level, and that with most staphylococci either method of controlling the reaction proved satisfactory for toxin production Some modification of Burnet's method—soft agar and excess carbon dioxide—is now almost universally used for the preparation of toxin by staphylococci It is only recently that the work of McClean (1937) has served to explain why agar is superior to broth It appears from his results that agar, cellophane, filter paper, kieselguhr, and kaolin act as adsorbants, removing from broth some unidentified substance which is prejudicial to the formation of toxin

Preparation and Effects of Staphylococcal Toxin

Following Burnet's work many papers were published dealing with the preparation and effects of staphylococcal toxin When its lytic action was investigated it was found that in some cases it acted like other haemolysins at 37° C, while in other cases lysis occurred chiefly at air temperature after the lysin and cells had been kept for some time at 37°, the "hot–cold" phenomenon of Bigger, Boland, and O Meara Differences were also observed in the power of lysin to haemolyse the cells of different animal species The confusion and controversy were resolved by Glenny and Stevens (1935), who showed that staphylococci might produce either one, or both, of two lysins which they called α and β The α lysin acts on both sheep and rabbit cells at 37° C., the β only on sheep cells, and, on them, best at air temperature after contact at 37° There is now fairly general agreement that the α lysin is identical with the skin necrosing toxin and the rapid-killing toxin The β lysin has some toxic action, causing a flush without necrosis or intradermal inoculation, and is probably responsible for the delayed death of inoculated animals The two substances are now usually called the α and β toxins Glenny and Stevens found, in the case of the staphylococci which they investigated, that the majority produced only α toxin, that a few produced both α and β toxins, and that none produced only β toxin Minett (1936) reinvestigated this question using staphylococci from both human and animal sources and found that almost all animal strains produced β toxin, usually associated with α, but in a few

The treatment of Urinary Infections

The value of mandelic acid therapy in urinary infections is now established, and one or other of its salts, for example, ammonium mandelate (Mandelix) or calcium mandelate (Mandecal), is administered by the physician in practice in full assurance of a certain well-defined therapeutic effect

MANDELIX

Mandelix — an elixir of ammonium mandelate — provides a means of practising mandelic therapy in its simplest form, inasmuch as by its use the pH of the urine is maintained at the prescribed level without the collateral administration of ammonium chloride Its administration results, even in cases having a chronic infection, in the establishment of sterile urine within a week

MANDECAL

Mandecal is a pleasantly flavoured preparation of pure calcium mandelate in powder form Being readily miscible with water it is simple of administration, it is therapeutically effective and its administration is not followed by any dyspeptic discomfort such as that which occasionally occurs during protracted treatment with other mandelic acid preparations

THE BRITISH DRUG HOUSES LTD LONDON N 1

immune, is invaded by staphylococci phagocytes accumulate In the non-immune animal these are to a large extent rendered ineffective by leucocidin, but in the animal immune to leucocidin and other toxins phagocytosis proceeds actively The cocci appear to exercise a positive chemotaxis, but where are the opsonins which we were taught were essential for ingestion? All modern work disregards them to such an extent as to suggest that the current, although unexpressed, view is that if staphylococci and polymorphs come in contact the latter will ingest the former if they are not rendered incapable of doing so by the leucocidin secreted by the cocci The positive action of opsonin has been replaced by the negative—that is, neutralizing—action of antitoxin, and a high opsonic index means no more than a high level of serum antitoxin While accepting as well established the importance of antitoxic immunity, I am loath to jettison completely the old opsonin After all, it is the cocci, either alone or in conjunction with opsonin, and not the toxin, which lead to the mobilization of polymorphs, and why should the positive chemotaxis which has attracted the cells to the vicinity of the site of invasion stop short of contact and then of ingestion? The neutrophil leucocytosis which is such a constant result of the invasion of the body by staphylococci demonstrates the effect of the cocci In my view it would, for the present at least, be unwise to concentrate all our attention on antitoxins and to neglect anti-bacterial immunity It may be that the success of vaccines in the treatment of chronic or recurrent staphylococcal lesions —a success which cannot be denied and to which was mainly due the vogue of vaccine therapy in general —was due to the close association of toxin with the cocci, and to the production of toxin by the growth of the cocci on solid media The vaccine which we administered contained either toxin or toxoid or both, and the successful result of our treatment was due to these rather than to the actual cocci Now, I suggest, we should attempt to increase antitoxin in the circulation either by active immunization with toxoids or by passive immunization with antitoxic serum—both of which methods have demonstrated their value in human infections—and anti-bacterial bodies by active immunization with vaccines completely freed from toxin

Let us now attempt to derive some lessons of practical value from the mass of literature published during the past fifteen years

Lessons from the More Recent Literature

The *Staphylococcus pyogenes* is a Gram-positive coccus, typically occurring in clusters, and is a common human parasite The great majority of these staphylococci form, as judged by serological methods, a fairly homogeneous group consisting of three types In culture they may display a greater or less power of pigment production, the colonies varying in colour from golden brown to white, the more highly pathogenic strains being usually well pigmented The power of liquefying gelatin and of fermenting carbohydrates is inconstant, but pathogenic strains usually liquefy gelatin and ferment mannitol The pathogenic power of the organisms is due chiefly, if not entirely, to the exotoxins they produce, which include some, or all of α toxin, β toxin and leucocidin and possibly other similar substances They also produce coagulase, which causes the clotting of plasma followed by liquefaction In the tissues they exercise a positive chemotaxis, attracting polymorphonuclear leucocytes to the affected part For their elimination the body relies chiefly on the action of these cells, but for the prevention or limitation of damage chiefly on antitoxins The staphylococci are among the commonest saprophytes and pathogens associated with man They are frequently found on the surface or in the glands and follicles of the skin, living either saprophytically or displaying pathogenicity expressed in a long range of action between insignificant pustules and massive carbuncles, and including boils, acne, sycosis, and other skin diseases Another important site from which they spread to other parts of the body of the same person, or to other persons, is the nose and nasopharynx Here they may cause furunculosis, may be responsible for sinusitis, or may be present in the carrier state From their primary site of invasion they may spread by the blood stream, in bacteriaemia septicaemia, or pyaemia, to other situations, particularly bones and joints, the kidneys, and the heart, in some of which, but more particularly in bones, they may be responsible for lesions of great chronicity The general effects of these toxins are not yet well understood, but may include damage to the heart and pancreas As regards the latter, there is a definite connexion between staphylococci and sugar metabolism, as is shown by the occurrence of glycosuria in association with boils and carbuncles and of boils and carbuncles in association with diabetes The claim that certain cases of diabetes are benefited by active immunization with staphylococcal toxoid is at least worthy of serious investigation

In connexion with infection by staphylococci the almost universal presence of these organisms on the skin and their frequent presence in the nares must be borne in mind To infect, however, more than their presence is required, and such factors as sugar metabolism and local trauma including pressure or friction such as that inflicted by a collar, should be investigated and the necessary corrections applied Where lesions occur, fresh infections are best controlled by the use of suitable disinfectants wet dressings are best avoided owing to their fostering action on the growth of the cocci

Treatment of Staphylococcal Infections

In the treatment of infections the keynote should be rest and lack of interference The importance of avoiding any surgical intervention in staphylococcal lesions about the face, owing to the risk of spread of cocci by blood stream or lymph, is now well known, but the same inactivity should be pursued in the case of boils and carbuncles wherever situated Early incision is fraught with great danger, and Nature should be allowed to wall off the affected area by the coagulation of plasma and by the accumulation of polymorphs Only when liquefaction has occurred should the surgeon be permitted to make a way of exit for the pus, and his incision should never transgress the protective zone When the general symptoms are marked or the local lesion extensive, as in a carbuncle antitoxic serum should be administered Its utility in its present form is undoubted, and even better results may be expected when sera still richer in antitoxins to the three main toxins, α β, and leucocidin, and to any others which may be discovered, are available The treatment of more deep seated infections demands similar measures, with special emphasis on the use of antitoxin

For chronic and recurring infections it is of importance to attempt to find a focus, often unnoticed, from which the cocci spread to other parts This is most frequently present in connexion with the upper part of the respiratory tract, particularly the nose Its treatment will often bring

TREATMENT OF THROMBOCYTOPENIC PURPURA*

BY

JANET M VAUGHAN, D M, M R C P

Senior Assistant in Clinical Pathology British Postgraduate Medical School

Idiopathic thrombocytopenic purpura may be defined as a disease characterized by a prolonged bleeding time and diminished platelet count associated with haemorrhages from mucous membranes and into the skin, the aetiology of which is not known Before making a diagnosis of idiopathic thrombocytopenic purpura it is essential to determine that no focus of infection and no sensitivity to any drug or food substances are present The disease may occur in an acute and chronic form, and is liable to spontaneous and sometimes complete remissions The effects of treatment are therefore difficult to assess Few observers are explicit as to whether the cases reviewed are acute or chronic

Many forms of treatment have been advocated Their number alone suggests that none are specific

Ascorbic Acid

Vitamin C has recently been used in the treatment of idiopathic thrombocytopenic purpura (Table I) No well-controlled observations on patients who have recovered are available The patient of Boger and Schroder (1934) was a man, aged 60, who had had no previous haemorrhage,

A=acute C=chronic.

and no control period was observed Vogt (1935) describes two successful cases The diagnosis in one was doubtful as genital abnormalities were found, in the other a blood transfusion as well as vitamin C was given, in neither was the rise in platelets marked Miller and Rhoads (1936) have published a preliminary report in which they claim that in four cases treated with ascorbic acid there was complete relief of symptoms and a rise in platelets No details are available apart from the fact that in two instances improvement was associated with increased output of vitamin C in the urine Wright and Lilienfield (1936) and Davidson (1936–7), on the other hand, each record three cases which failed to respond to parenteral treatment with ascorbic acid Szent-Györgyi and his colleagues (Armentano *et al* 1936) and Patek (1936) also state that they have found ascorbic acid valueless We have had a similar experience in one typical case Szent Györgyi (Armentano *et al* 1936) has recently isolated from lemon juice and from paprica a substance which he has called vitamin P or citrin, this is not present in orange juice He has found citrin of value in preventing haemorrhage in vascular purpura—that is, purpura occurring in patients with a normal platelet count though with decreased capillary resistance—but useless in thrombocytopenic purpura Thanks to the kindness of Dr Smith and Dr Macfarlane, who prepared some citrin according to the method of Szent-Györgyi, we were able to test this substance on one patient with thrombocytopenic purpura Neither the platelet count nor the capillary resistance was improved—in fact, the patient became so ill that transfusion was necessary (see Chart)

CASE RECORD

A married man aged 34 a tailor, had had crops of bruises for two years and bleeding haemorrhoids for two months He was admitted to hospital with profuse haemorrhage from the gums following teeth extraction On examination no physical signs apart from petechial haemorrhages and bleeding gums were found Blood pressure was 110/60, red cells, 4,100,000 per c mm, haemoglobin 74 per cent., colour index, 0.9, white cells 13,000 per c.mm., platelets, 10,500 per c mm The bleeding time (Dukes s method) was five minutes. The Wassermann reaction was negative, the capillary resistance test positive He developed a septic throat, the gums and remaining teeth were also septic

Treatment—On September 10, 1936, 80 mg of ascorbic acid were injected intravenously, this was continued daily for five days with no significant improvement in the platelet count. Doses of 80 mg of ascorbic acid were given by mouth daily from September 29 till November 2, when the dose was increased to 160 mg daily until December 13 From December 22, 1936, till January 26 1937, x-ray treatment to the spleen, totalling 4,500 *r* in fifteen periods, was given without significant improvement On March 9 40 mg. of citrin were injected intravenously, and the same amount on April 6 Throughout this period, in spite of injections for haemorrhoids the patient had repeated bleeding per rectum. Sigmoidoscopy showed this to be due to oozing from the whole rectal mucosa On April 13 the red cells numbered 3,700 000 per c mm, and the haemoglobin was 46 per cent. He refused splenectomy, and was given a transfusion The platelet count has never reached a figure higher than 160 000 per c mm and has shown considerable fluctuations (see Chart) He had always had a positive tourniquet test and crops of petechial haemorrhages or larger subcutaneous bruises have occurred spontaneously

The value of ascorbic acid in thrombocytopenic purpura is certainly open to doubt at present, while that of vitamin P is not proven Certain German workers (Schiff and Hirschberger, 1937) claim to have isolated a further vitamin, present in sesame oil, which they have called T This is said to exert a specific effect upon the platelets Further work is required to confirm their observations

Internal Secretions and Liver

Repeated, though unsatisfactory, attempts have been made to involve certain internal secretions in the control of the blood platelets Zondek (1936) treated a case of chronic purpura with thyrotropic hormone, and considered that a rise in platelets from 60,000 to 150,000 per c mm was a significant cure Others have used ovarian extracts Marzullo (1933) claims success in five patients, but gives no details of control periods or of the actual platelet counts Since the platelet count rises in Addisonian pernicious anaemia after liver therapy (Nittis, 1930–1) it was suggested that such treatment might benefit thrombocytopenic purpura (Table II) Satisfactory results have been claimed (Mondon, 1928, Holboll, 1929, Jacob and Clapperton, 1930), but the majority of the cases were acute and no satisfactory control period was allowed Witts (1931) had no success in five chronic cases

* Read at a joint meeting of the Sections of Pathology and Medicine at the Annual Meeting of the British Medical Association, Belfast, 1937

SCHOOL CHILDREN *ESPECIALLY* . . .
ARE FOND OF THIS PURE FRUIT JUICE

GOOD work as every doctor knows is very often dependent upon good health. And a well regulated diet is important for maintaining good health

Dole Hawaiian Pineapple Juice is the natural juice of sun ripened Dole-grown pineapple It contains no added sugar or preservatives of any kind

The exclusive Dole Fast Seal Vacuum Packing Process retains, to a high degree those important fresh fruit constituents found in the ripened pineapple so valuable not only to growing children but to adult as well! Also this tangy tropical juice is a natural source of vitamins A B and C. That's why with schooltime when parents are asking about diets and menus for their children, you can recommend with assurance pure unsweetened Dole Pineapple Juice—the original pineapple juice from Hawaii

J. K. Husband & Co., Ltd., 10 Eastcheap London, E.C.3

HERE IS A TYPICAL ANALYSIS OF DOLE PINEAPPLE JUICE:

Moisture	85.3%	Crude Fibre	0.02%
Ash	0.4	Titratable acidity as citric acid	0.9
Fat (ether extract)	0.3	Reducing sugars as invert sugar	12.4
Protein (N × 6.25)	0.3	Carbohydrates other than sugars (by difference)	0.38

P.S. We would like you to enjoy a long cool glass of this refreshing juice! Write to us on your letterhead and we will send you a sample tin free

THE LEI WOMAN—An old Hawaiian custom ever new is the habit of decorating departing or returning friends with beautiful wreaths of native flowers The fragrant ilima maile plumeria pikake and ginger are used extensively in the making of leis It is a picturesque sight on steamer days to see the native women with their skilful hands weaving the fragrant garlands

GONADOTROPIC HORMONE THERAPY

Gonadotropic hormone therapy has hitherto been confined to the use of urinary hormones, such as GONAN, *with predominantly luteinising properties A follicle-stimulating hormone from the serum of pregnant mares is now available under the name* SEROGAN

SEROGAN

The action of SEROGAN is predominantly that of ovarian follicle stimulation It is therefore specifically indicated in the treatment of conditions resulting from deficient follicular secretion, such as amenorrhœa, hypomenorrhœa, or dysmenorrhœa associated with uterine hypoplasia

GONAN

GONAN is the gonadotropic hormone from the urine of pregnancy, and its effect upon the ovary is primarily luteinising It is used to stimulate the luteal secretion in habitual abortion, menorrhagia, metrorrhagia or spasmodic dysmenorrhœa associated with normal uterine development

* These figures include those of previous summaries, notably those of Spence (1928) and Quénu (1929)

show that acute cases were treated, that no control period was given, and that the follow-up was short Pancoast (1925), who had a follow-up of three years in some instances, reported complete failure in five chronic cases and in one acute case Interest in this form of therapy has recently been revived by the report of Mettier and his colleagues (Mettier, Stone, and Purviance, 1936, Mettier, 1937) They record success in seven chronic cases An increase in platelets occurred within twenty-four to forty-eight hours, rising as high as 250,000 to 500,000 within nine days In some instances relapse occurred one to seven months after the cessation of treatment Rudisill (1936) concludes from a study of seven patients that Roentgen radiation constitutes an exceedingly valuable and possibly a specific therapeutic agent when applied over the spleen in primary or complicated thrombopenia with haemorrhage His case records are, however, scanty We have found, in agreement with Jones and Tocantins (1936), Marzullo (1933), and Davidson (1936–7), that x-ray therapy is without effect (see Chart)

Splenectomy

The majority of observers agree that at present splenectomy (Table V) gives more satisfactory results than any other line of treatment in thrombocytopenic purpura The operation was first performed in 1916 at the suggestion of Kaznelson Since that time all reviews have shown increasingly satisfactory results, presumably as preoperative, surgical, and anaesthetic technique improved Whipple in 1926, reviewing eighty-one cases, found an *operation mortality of 16 per cent*, a risk which was constant in 1929 when Quénu surveyed 122 cases Eliason in 1932 observed that the operation mortality had dropped to 13 per cent, while Giffin (1932), reviewing the experience of the Mayo Clinic found the rate to be as low as 7 per cent, a figure which was present two years later when thirteen additional cases were discussed (Pemberton, 1934) Brown and Elliott (1936) performed ten splenectomies without post-operative disaster The series of Brown and Elliott (1936) is of considerable interest since eleven untreated cases were used as a control group Three of the latter recovered completely, but five were unimproved and two were only slightly better Splenectomy, though it would undoubtedly appear to result in clinical improvement, does not necessarily affect the platelet count except transitorily (Evans, 1928, Spence, 1928, and Brown and Elliott, 1936) There is usually a definite pre-operative rise, though not necessarily to normal figures, followed by a fall, the count being then maintained at a low level Until recently it has been thought that the operation risk in acute cases was too great to justify splenectomy in fulminating purpura Whipple (1926) records seven deaths in eight acute cases at operation, Spence (1928) ten deaths in twelve cases Eliason (1932), however, in twenty-two patients splenectomized during a fulminating attack between 1928 and 1932, found the mortality had dropped to 13 6 per cent, a figure accepted as representative of modern results by Brown and Elliott (1936) Few cases are reported in which the results are satisfactory for the first few months after splenectomy but which subsequently relapse (Williamson, 1934) It appears probable that such relapses are due to the development of a splenunculus, and are by no means an inevitable result of splenectomy Maingot (1936), who made a careful search for accessory spleens in a series of thirteen cases of splenectomy for purpura haemorrhagica, found them in seven There are several patients who have remained well for as long as eleven years after operation

TABLE VI—*Summary of Treatment Results*

ever, be understood that the prespastic emotional life constitutes the basis of later disorder, for from its constituent elements may be eventually forged the dynamic energy of psycho autonomic activity

Case 1—An only child, aged 7 had suffered from allergic bronchitis since infancy The father was a chronic dyspeptic and the mother had migraine After the birth of her child the mother seemed to lose a guiding motive in life Migraine attacks became frequent The suggestion of a holiday or other form of amusement invariably initiated an attack Several times a week the child would see her mother incapacitated by headaches The aura of 'over protection' was later extended to the child The latter developed measles, which ran a protracted course During convalescence her appetite became fickle She wished to be left alone in a semi darkened room and at times would weep copiously, stating she had not strength to get up The mother's anxiety intensified these childish reactions The little patient was eventually ordered to get up and was dressed It was then noticed that she was speaking like a child of 2 and walking with a corresponding gait. She was thus recapitulating in her own way those characteristics of infantile regression which appeared in a modified form in the mother

Allergic Causes of Emotional States

When there is an overstepping of allergic tolerance and asthma ensues a further disturbance of the pre existing tension states takes place The most important clinical feature is the lack of psychic "buffering"

In the immediate prespastic stage the child as a rule becomes forgetful and is unable to concentrate Problems which normally present no difficulty seem insuperable barriers, and the patient becomes irritable and fidgety The shoulders become hunched forward in an expectant attitude The normal facial contour is haggard and drawn, and replaced by an apprehensive mask The child may be taken home from school and submitted to the care of parents whose anxiety not uncommonly enhances the apprehensive aura of the child It is easy to understand the psychic changes that ensue Judgement becomes progressively impaired, a turmoil of anticipatory ideas proceeds from strength to strength, and by an association network rendered momentarily freer extends the range of fear memories Thus it is that so frequently we find bouts of rage and uncontrolled wildness alternating with terror and the assumption of the characteristic spastic posture

Statistical realism in thought is replaced by a primitive "magical' thinking whereby affect is detached from the ego and externalized Every word or action in the non-ego is invested with potential danger The visit of the doctor and the view of his apparatus are identified with the fear which they might be expected to provoke "What is this for?" "What will it do?" "Will it hurt me?" 'I won't have it!' "I don't like it!' I'll run away!" Two cases illustrate this clearly

Case 2—A boy aged 9 developed asthma at the age of 5 He was the eldest of four children The attacks had occurred at about monthly intervals when I was asked to see him as he had recently become hopelessly unmanageable On three occasions he had attempted to set the house on fire Bouts of almost sadistic cruelty to the younger children would alternate with biting and scratching his governess On my arrival he refused to see me and hid in the garden Eventually he was carried by two servants into the house yelling and biting After a time I talked to the child quietly, but was unable to carry out any examination On departing he subjected me to a torrent of abuse and evolved an amazing scheme for my destruction When you come back you won't find me here I will climb up on the roof and wait for you I will take up a big stone, a heavy stone, and when you are standing at the door I will drop it on your head" Three months later freed from allergic thraldom, this patient had become a quiet, well mannered boy

Case 3—A boy aged 10 had a history of allergic bronchitis in childhood Urticaria and eczema supervened with hay fever and eventually asthma He was extremely emaciated nervous and emotionally unstable and the same type of psychical reactions were present as in the former case His method of avoiding a potential source of recurrent danger was unique He waited behind a hedge in the drive with an air gun anticipating my visit After four months treatment by eliminating diets his asthma had ceased and he was able to live as a happy and sociable member of society

Not merely does clinical evidence show that allergic activity may enhance psychic chaos, but biochemical evidence proves it The Prausnitz-Küstner reaction which can be obtained in nearly all those patients gives positive evidence of the presence in the circulation of sensitization substances, apparently clinically capable of producing gross psychological disorders Indeed it is almost safe to assert that at certain times allergic thraldom may bear the same relation to the nervous factor in the asthmatic as does a positive Wassermann to the psycho pathology of cerebral syphilis Yet it would enable us to understand the freakishness of asthma better if we were able to prove that psychological factors could exalt or lower the allergic threshold on biochemical evidence In this connexion the following experiment may be of interest

Case 4—On preliminary investigation an asthmatic girl aged 18 gave a severe cutaneous reaction to an intradermal test for egg sensitization A wheal one inch in diameter surrounded by a raised erythematous zone three and a half inches across developed around the site of inoculation Next day the test was repeated whilst the patient was deeply hypnotized The suggestion was given that no reaction would occur The patient was kept under hypnosis for half an hour and the suggestion was frequently repeated No wheal developed and there was no erythematous blush Sphygmographic tracings of the pulse were taken before and during the experiment As soon as hypnosis was induced the tracing altered markedly The excursions became accentuated and more frequent There was a sharp rise and fall The predicrotic notch was registered close to the base line The blood pressure increased from 110 mm Hg systolic and 65 mm diastolic to 130 mm Hg systolic and 75 mm diastolic Next day the experiment was repeated in the patient's normal state and the original wheal was obtained

Should this paroxysmal overstepping of the allergic threshold continue unchecked a stage is eventually reached where great modification of personality temporarily ensues The psychological reactions evoked thereby come to dominate the cerebration for the time being and arouse anomalous conduct disorders, as in the following case

Case 5—A medical student aged 19 states as follows 'For several days prior to an attack I have a craving for highly seasoned or unusual food I tend to smoke a great deal My powers of concentration are greatly diminished I begin a conversation but rapidly lose the train of thought. I may stop short in the middle of a sentence groping for a suitable conclusion which evades me A few moments later I remember the conclusion and mix it unaccountably in a new group of ideas These ideas become more and more tinged with emotion My voice becomes high pitched later reaching an almost hysterical scream I seize upon irrational and illogical facts with frenzied fervour and attempt to put them over with unjustifiable conviction Increasing irritability makes me dwell upon ideas of resentment The fancied slights of friends are magnified and distorted I remember my enemies with bitterness Rage begins to riot in my mind In fancy I see myself a dictator meting out swift justice to all whom I hate Mentally, I torture them with sadistic glee.

Arsenical Preparations in the TREATMENT OF SYPHILIS

NOVOSTAB
TRADE MARK BRAND
NEOARSPHENAMINE B.P

Novostab possesses high therapeutic activity combined with low toxicity It may be administered either in aqueous solution or dissolved in Thiostab (sterile sodium thiosulphate solution)

Approved by the Ministry of Health for use in Public Institutions

STABILARSAN
TRADE MARK BRAND
ARSPHENAMINE DIGLUCOSIDE

A stable compound of arsphenamine and glucose supplied in solution ready for use

Approved by the Ministry of Health for use in Public Institutions

SULPHOSTAB
TRADE MARK BRAND
SULPHARSPHENAMINE B.P.

The Arsphenamine compound recommended for deep subcutaneous or intramuscular injection Particularly suitable for Congenital Syphilis

Approved by the Ministry of Health for use in Public Institutions

intense the emotional lives of its parents the more easily will the child energize the reflex paths with purposive intent

Case 7—This patient, a boy aged 11 had a history of eczema and cyclical vomiting with asthma for three years sensitized to egg milk and fish After treatment he acquired a new poise in life took a renewed interest in hobbies and physical recreation and his physical appearance improved correspondingly If however, he received a reprimand or his wishes were in any way thwarted a change at once came over him The pupils dilated the shoulders hunched forward and he threw himself into the posture of expectant defence'

It must be emphasized, however, that this phenomenon is particularly noticeable when allergic imbalance is intensified, and tends spontaneously to disappear as effective therapy is instituted The pattern of the reactions alters during treatment and our psychotherapeutic invasion of the patient's psychical life will be modified in consequence

Hysterization

A stage may be reached when attacks no longer depend on allergic catalysts According to the personality reactions of the child, the habituation reflex may be used independent of its allergic origin Perhaps primarily it is anticipatory Emotional factors alone may be the "trigger which excites an attack It may also be employed as the explosive demand for sympathy, or as a way of escape from unpleasant or undesirable situations

By extended associations the psyche becomes subjected to an increasing number of involved conditioned stimuli until great complexity and intricacy of behaviour ensues This fact must be borne in mind when dealing with asthma, for not merely must the patient's allergic background be overcome, but social or environmental maladjustment may require to be corrected It is perfectly true that removal of the offending allergens may alone enable the patient to attain psychical poise and readjustment, but it is important to stress early recognition and treatment to avoid the habituation reflex which so frequently results Every time the nerve stimuli traverse a given path they facilitate the passage of later impulses

Case 8—A boy aged 12 had had asthma for eight years His mother died six weeks after his birth He was brought up in the charge of a devoted nanny for whom he cherished a deep affection His father sent him to Leysin where he had treatment for two years He had no attacks in Switzerland gained rapidly in height and weight, and was sent home assured that the asthma would not return At school in the South of England he made rapid progress taking a prominent part in sports. One day his father came to inform him that he intended to marry again That night the boy had one of the severest attacks of asthma he had ever experienced The cure' at Leysin had not sublimated the latent emotional factor

Arbitrary Reflex Reinforcement of Bronchospasm

This is a phenomenon which may appear in a greater or lesser degree in most asthmatics It is seldom in evidence in the absence of an audience, is frequently observed in early chronic cases and reaches its climax in the psychotics It must be emphasized that its origin is entirely psychological The more pronounced the latter factor the more readily will the phenomenon appear in emphasis Its machinery of expression is through the accessory muscles of respiration

In the presence of bronchiolar contraction these muscles are called into play to assist chiefly the distressed expiratory effort Should the patient however in the presence of anxious relatives be dominated by the urge to emphasize the distressing nature of his condition he may arbitrarily reinforce the action of the accessory muscles The expanded alae nasi may be contracted The sterno mastoids bulge in accentuated emphasis, the shoulder-tips thrust forward, and the thoracic spines curve markedly The chest wall is compressed on a rigid diaphragm with compelling insistence The inspiratory effort is correspondingly laboured with almost masochistic intent

In this connexion the following case may be of interest.

Case 9—A youth aged 17 developed asthma after leaving school at the age of 14 His parents had always considered him to be rather queer His father was an asthmatic The patient had numerous jobs which for unsatisfactory reasons he gave up in melancholy succession Eventually his asthma incapacitated him from following any employment For days at a time he would lie in bed wheezing and he refused food He became slovenly and untidy in his habits withdrew more and more from the company of his friends, and developed a morbid introspection One day I found him asleep the breathing was quiet and regular On being awakened he at once assumed the condition above described and this continued till his lips were cyanosed and adventitious sounds filled the chest He was sharply reprimanded and ordered to throw back his shoulders and to breathe slowly on command The sterno mastoids relaxed breathing became slow and regular the strident rales disappeared and the dusky hue left his lips

In other cases simpler forms of distraction may suffice to emphasize the fact that such reinforcement of respiration can voluntarily occur The fixation of the patient's gaze on a bright object above the eyes and the suggestion of calm and quiet breathing displace the respiratory emphasis

Psychotic Dissociation

In a small proportion of chronic cases (2 per cent) the motivation is apparently derived from very old and involved complexes In these cases it is, as a rule, difficult to trace an allergic inheritance, nor do the patients *per se* exhibit associated allergic conditions Being autistic in temperament and well-nigh divorced from realism, with an intense ego-localization, they live at the level of midbrain philosophy The deep psychic values of the retreat into illness' cannot be surrendered to any form of sublimation I was not able to obtain the Prausnitz Küstner reaction in those patients They are non hypnotizable, and the asthma appears to be of purely endopsychic growth Psycho analysis apparently aggravates the condition Narco analysis with sodium evipan has been tried unsuccessfully, dietotherapy and insulin injections have proved unavailing Nor have I found these patients amenable to any form of therapy with which I am acquainted

Case 10—This patient a girl aged 18 the daughter of an epileptic mother had had asthma for twelve years She had been bright at school until 10 years old then became queer She believed that a gipsy had cast a spell over her and that she could never recover Eventually she was placed in an institution Cutaneous tests gave negative results The Prausnitz-Küstner reaction was also negative In my opinion the condition was entirely endopsychic in origin No success attended therapy

Nocturnal Asthma

Since most asthmatic attacks take place in the early hours of the morning it seemed feasible that the investigation of the psychological factor might be approached by an analysis of the dream-life of these patients During sleep the vagus is active and exhibits a tendency for easier reflex activity Sleep is associated with far reach

Convalescence

In convalescence a tonic is required that will co-operate with and augment, the natural recuperative powers of the body, rather than one which will have only an immediate stimulating effect. In the latter case there is always the danger of disappointment, due to an artificial improvement that the natural powers are unable to stabilise.

Medical evidence extending over many years has established the value of Sanatogen in promoting convalescence In "The Elements of Pharmacy, Materia Medica and Therapeutics" Sir William Whitla writes —

> "The interesting and valuable researches conducted by Tunnicliffe and Beddoes upon metabolism, in which Sanatogen was experimented with establish the fact that its organic phosphorus is almost entirely assimilated when the food is administered in the amount necessary for the needs of the body When given in addition to other food the amount of nitrogen and phosphorus retained in the organism is increased the tissue metabolism is more complete, the constituents of the ordinary food being more thoroughly utilised, appetite is increased and the body weight augmented"

Similarly gratifying observations are constantly being notified, and, as Sanatogen is entirely free from fats, sugars and carbohydrates, it can safely be prescribed in all types of cases. It is rapidly and easily digested and assimilated, even in cases exhibiting severe gastric inflammation and for this reason it is a valuable addition to enemata. It can be added to any non acid beverage or food and consequently, monotony in its administration can always be avoided.

SANATOGEN

A CHEMICAL COMBINATION OF 95% MILK CASEIN AND 5% SODIUM GLYCEROPHOSPHATE

Clinical samples and literature available on request to

GENATOSAN LTD, LOUGHBOROUGH, LEICESTERSHIRE

DOSAGE: For children and adults two teaspoonfuls three times daily or according to circumstances For infants, 1 teaspoonful added to each bottle feed.

Sold by all chemists price 2/3 to 19/9

4 According to the temperament of the child, this reflex may be used as "a retreat into illness" or a psychopathic way of escape from reality

5 The sense of organ inferiority can energize emotion into a physical expression

6 Frequent repetition of the original stimulus leads to diffuse psychic derivatives, which eventually permeate and colour the life of the individual, and can at any point lead to an attack

7 This factor more than anything else explains the freakishness of asthma

8 Where the psychic factor predominates therapy is prolonged and uncertain

9 In a small but definite proportion of cases asthma is the expression of a definite psychosis

BLOOD BROMIDE INVESTIGATIONS IN PSYCHOTIC EPILEPTICS

BY

LOUIS MINSKI, M D, M R C P

Deputy Medical Superintendent St Ebba's Hospital

AND

J B GILLEN, M B, D P M

Temporary Assistant Medical Officer

Recently many articles have appeared on bromide intoxication in the neuroses and psychoses, but no investigations seem to have been carried out on the chronic epileptic population of mental hospitals who have been given bromide over a number of years For this reason thirty-two epileptics (twenty females and twelve males) who had been having bromide for periods ranging from ten years to one year had their blood bromides investigated It was found that if 90 grains of bromide a day were prescribed, at the end of ten years 6 cwt of the drug had been consumed, and in this category there were seven patients while the remainder had had the same daily dose of bromide over a period of four to seven years In addition many of these patients were taking luminal or prominal

Katzenelbogen (1932) raises the question as to whether the haemato encephalic barrier plays a part in bromide intoxication in view of the fact that bromide intoxication may occur with low concentrations of bromide in the blood and on the other hand sometimes no signs of intoxication occur with high concentrations He found in eighty-seven cases in an epileptic colony that the barrier permeability was increased in twelve cases, showed a moderate rise in twenty four and decreased in nine while in forty two the distribution ratio of bromide between the blood and cerebrospinal fluid was normal He also observed that there appears to be no relation between the mental state of an epileptic and his barrier permeability to bromide Other writers (Walter, 1929, Weil, 1927) appear to have found no constancy regarding the permeability of the haemato encephalic barrier in epileptics

As will be seen later, many of the epileptics under investigation showed comparatively low blood bromide levels considering the amount of bromide which had been taken, and Quastel and Yates (1934) found that in all patients, independent of their mental states, the blood bromide rose markedly after oral ingestion of sodium bromide, and that the low bromide levels in certain psychotic patients could not be ascribed to lack of absorption of bromine into the blood stream

The ages of the patients investigated ranged from 68 to 23 years, and the only instances of physical disease were in nine patients who suffered from arteriosclerosis and one who had chronic bronchitis The highest blood bromide was 275 mg per 100 c cm in a patient of 62 who had been on 90 grains of bromide a day for ten years Two other patients, aged 64 and 68 respectively, who had had similar doses of bromide over a similar period, had blood bromides of only 150 and 125 mg respectively All these patients showed evidence of arteriosclerosis, while younger patients about 30 years of age who had had similar quantities of bromide, and who showed no signs of physical disease, had blood bromides of well over 200 mg There were no marked signs clinically of bromide intoxication in any of these patients, who were all on similar diets and in whom the chloride intake could be assumed to be fairly general This would appear to differ from the usual findings of most writers (Barbour, Pilkington, and Sargant, 1936) that older patients and those with arteriosclerosis, renal insufficiency, etc, tend to show early signs of intoxication

Barbour (1936) states that the greater part of the bromide is excreted by the kidneys and that the blood bromide level varies with the urinary output, which in turn depends on the fluid intake and renal efficiency In those patients with arteriosclerosis there was evidence of impaired renal efficiency also, and the bromide was excreted more slowly than in patients who were physically well This was shown by examination of the blood bromide levels taken at various times after the bromide had been discontinued and chlorides administered In all cases sodium chloride, 30 grains thrice daily, was given to help in the elimination of the bromide

Mental States

All of the thirty two patients examined showed marked intellectual deterioration with impairment of memory, emotional facility and instability, childishness, and irritability Many of them were disorientated, suffered from paranoid delusions with auditory hallucinations, and were inclined to have attacks of violence In addition they were restless, quarrelsome, and revealed the typical 'difficult' behaviour of the epileptic No patients presented in a typical manner any of the symptoms of a toxic confusional state usually associated with a bromide intoxication, nor were any neurological signs found Although, as stated, several cases suffered from auditory hallucinations and disorientation, no evidence of visual hallucinations was observed Bromide paranoid states have been reported but the patients in our series who exhibited this type of reaction showed considerable deterioration also

THE Hepatex LIVER EXTRACTS

Products of Evans' Biological Institute

HEPATEX (ORAL)

A highly concentrated liver extract. Palatable and easily assimilated.

Prepared by a process which conserves the hæmopoietic potency of sixteen times its weight of fresh liver

Issued in 4 fld oz bottles - 12/6 each

NEO-HEPATEX

(PARENTERAL)

For intramuscular and intravenous use.

The remarkable efficiency of Neo-Hepatex provides fully adequate dosage in small volume

Issued in boxes 6 x 1 cc 5/ 6 x 2 cc 7/6 3 x 4 cc 6/6

TREATMENT OF OBSTINATE OEDEMA BY MULTIPLE PUNCTURES

BY

MIN SEIN, M B, M R.C P.

Captain Indian Medical Service Burma

Cases crop up now and again in medical practice where obstinate oedema defies treatment by medical means Such cases are seen in the late stages of cardio renal *failure when, apart from the discomfort arising from the* oedema, the patients suffer from attacks of nocturnal dyspnoea Prognosis in these cases is extremely poor, but any treatment which enables life to be prolonged in fair *comfort and also reduces the suffering should be wel*come The medical treatment (Christian, 1936) usually adopted consists in the employment of cardiac tonics and diuretics such as the digitalis group of drugs, ammonium chloride, urea, novarsurol, salyrgan, and other mercurial preparations A light and easily digestible salt-free diet is provided and the fluid intake is restricted The patient is kept in the most comfortable position for the relief of orthopnoea

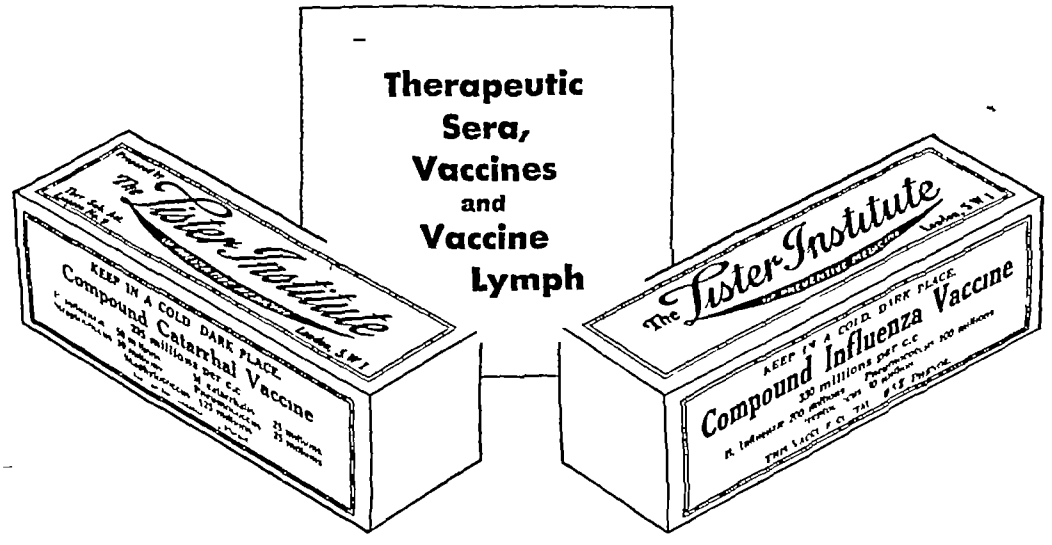
Where the above measures fail to afford relief it will be necessary to consider the removal of the oedema fluid by mechanical means By this method large amounts of fluid could be removed in a comparatively short time, so that it might profitably be employed in the earlier stages instead of waiting until the system is waterlogged

According to Bland and White, whose views other authorities share, the mechanical removal produces a threefold result ' first, by reducing the size of the distended parts the patient is made more comfortable, *secondly, the already overtaxed and failing circulatory* system is relieved of an additional burden, and finally, the partial removal of what has been called by Galli the ' peripheral barrier to the circulation favours a more adequate reabsorption of the remaining fluid by subcutaneous veins and lymphatics Furthermore, it is assumed that the oedema fluid is toxic and possibly acts deleteriously on the vascular endothelium, making it more permeable and creating a vicious circle which is likely to be broken by the removal of the fluid

Mechanical Methods of Removing Oedema Fluid

The methods in vogue are three in number—namely, (1) the use of Southey's tubes, (2) punctures with a needle, and (3) scarification or incision with a knife Of these, Bland and White recommend the use of Southey's tubes in preference to the others They described eight cases in which they had employed this method Pallasse, using Southey's tubes, had only one case of infection out of ten Destéfano finds a platinum needle 4 cm long in each leg satisfactory and records a case in which 27 litres of fluid were drained off in twenty four hours Recently Leech has devised a modification of Southey's tubes which he considers an improvement on the original tubes, because in his experience the latter tend to get blocked after draining for a comparatively short time The tube is made bigger and contains ridges on the sides to prevent it slipping off the tissues Heinecke recommends scarification or punctures, though he admits the possibility of inconvenience and infection by these methods Hamilton realizes the necessity of the employment of local measures in occasional cases, but does not prefer any one method Foit is in favour of multiple punctures, and among British authorities Carr wholeheartedly supports this method and considers it far simpler and more efficient than Southey's tubes Bennett recommends a small horizontal incision over each malleolus Textbooks of medicine are divided in their preference for the methods to be employed Hutchison's *Index of Treatment* made no mention of the mechanical means of dealing with obstinate oedema under nephritis and heart failure From the above it is apparent that the mechanical removal of oedema fluid is accepted as having a decided value in the treatment of obstinate oedema

Of the three methods mentioned scarification is impracticable for several reasons One should be chary of cutting down to the deep fascia as has been recommended by Fishberg and Cecil when the tissues are devitalized through being sodden with oedema fluid Obviously infection would be difficult to avoid, healing is likely to be delayed, and should oedema recur the danger would be increased It must be admitted, however, that reports of cases in which severe infection has occurred are very difficult to obtain, but Cibils and others have reported a case of gangrene of the genitals caused by generalized oedema in lipoid nephrosis



Whilst both acupuncture and the use of Southey's tubes are serviceable therapeutic measures, Bland and White deprecate acupuncture for the following reasons (1) the difficulty of collecting and controlling the fluid that drains away (2) the risk of infection and ulceration due to constant exposure to irritating fluid, (3) the danger of erysipelas, resulting in the increase of the patient's suffering and acceleration of his death, and (4) constant wetting of bedclothes To my mind these risks are inherent to any surgical intervention in these cases and are not peculiar to acupuncture The dangers could be minimized by taking the following precautions The patient should be propped up on an easy- or deck-chair which has been well cushioned, and the feet placed in a basin supported on a footstool This eases the dyspnoea by making the patient comfortable, at the same time it promotes the gravitation of the oedema fluid to the legs The risk of infection is avoided by taking aseptic precautions before the acupuncture, by keeping the punctured areas covered with sterile gauze or lint, and by applying a bland ointment to the skin below the punctures to protect it from the irritation of the oedema fluid Thus the objections against the employment of acupuncture are easily overcome

Advantages of Acupuncture

Acupuncture has several advantages over Southey's tubes The method is easy and does not require the use of any special instrument little trauma is caused to the skin, and if necessary the punctures can be repeated, the method can be employed in the patient's home, since no special attention is necessary as when Southey's tubes are used It does not restrict the movements of the patient's legs as when needles are inserted into them It may be noted that the punctures are kept open by the pressure of the oedema fluid and that the flow of the fluid is controlled by this pressure It is therefore contended that acupuncture has a definite place in the treatment of obstinate oedema, this method would be particularly useful in the Tropics, where there is little risk of the feet being chilled by the oedema fluid

The Technique

Having placed the patient in the position indicated, the legs and feet are prepared as for an operation Methylated spirit is preferred to iodine for sterilizing the skin,

The Lister Institute OF PREVENTIVE MEDICINE

Compound
Catarrhal Vaccine

In catarrhal conditions of the respiratory passages mixed infections are found more often than pure infections with one type of organism *Bacillus influenzæ* Pneumococcus and *Micrococcus catarrhalis* are believed to be the commonest primarily infecting organisms, but Streptococcus and Staphylococcus seem to be responsible for many of the secondary infections A mixed vaccine has been prepared from these five kinds of bacteria It is generally given as a prophylactic but may also be used in acute respiratory infections

DOSAGE.—Prophylaxis 1st dose, 50 million *B influenzæ* 10 million Streptococcus, 25 million *M catarrhalis* 25 million *Pneumococcus*, 125 million Staphylococcus Subsequent doses at intervals of 7 to 10 days, gradually rising to 8 times the original dose. Then 4 to 8 times the initial dose every 4 to 8 weeks

Treatment—¼ to ½ of the prophylactic doses.

PRICES—Ampoules containing

235 million organisms per c c	each	2/6
470	"	2/6
940		2/6
1 880	"	2/6

10 c c. rubber-capped vials containing 470 940 or 1880 million organisms per c c. each 15/
25 c.c. ditto ditto each 25/

Compound
Influenza Vaccine

The Compouhd Influenza Vaccine prepared by the Lister Institute contains the chief types of bacteria found in the catarrhal secretions of the respiratory passages in epidemic influenza, viz *B influenzæ*, Pneumococcus and Streptococcus It is primarily intended as a prophylactic, but may also be used for treatment

DOSAGE—Prophylaxis 1st Dose, *B influenzæ* 200 million, Pneumococcus 100 million, Streptococcus 30 million=330 million organisms 2nd dose, 660 million organisms 7 to 10 days later In treatment 1/5th to 1/20th of the prophylactic doses may be given commencing with the lower dose in severe cases.

Compound Influenza Vaccine

PRICES—
In ampoules of 1 c c. containing 330 or 660 million organisms per c.c., each 2/6
In 10 c.c rubber-capped vials containing 660 million organisms per c c., 15/
25 c.c. ditto ditto 25/-

pressure in the right chamber after birth preventing firm apposition of the valve-like fold from the left auricle, thus accounting for the increased incidence of this abnormality with pulmonary and tricuspid stenosis (Osler and McCrae, 1927) The presence of a patent foramen ovale is in all probability advantageous in these cases, as it allows blood from the pulmonary circulation to enter the systemic side and so eases to some extent the back pressure in the right auricle This may account for the fact that the patient managed to live to the unusual age of 19, since most of those with severe tricuspid stenosis die in infancy

The cyanosis of morbus cordis organicus, which was a prominent feature of this case, is usually accepted as being due to deficient oxygenation of the blood, this may be brought about by the abnormal mixing of venous and arterial blood or by mechanical obstruction to the pulmonary circulation, and in this case both factors probably played a part, accounting for the intensity of the cyanosis which was present Pulmonary stenosis as a cause of cyanosis is well known, and it is probable that tricuspid stenosis, by obstructing the flow through the heart even nearer to the systemic circulation, is more potent still in the production of this particular sign

The incidence of pulmonary tuberculosis with congenital heart disease has long been a debatable subject, and although such an authority as Rokitansky (1855) stated that tuberculous infection of the lungs did not occur in cardiovascular diseases associated with cyanosis, subsequent writers are not in entire agreement The subject has been clearly summarized by S Roodhouse Gloyne (1935–6), who states that the two diseases are not by any means incompatible, although the combination is a rare one It was stated by Fishberg (1932) that pulmonary tuberculosis was the cause of death in nearly all cases of congenital pulmonary stenosis in which childhood was reached, his suggested reason for this being that a relatively avascular lung provided a suitable nidus for the tubercle bacillus If this opinion is correct one would expect that tricuspid stenosis, by obstructing the blood flow into the right ventricle, would have the same effect. These cases should therefore fall under the same category, although the number reported is too small for any accurate conclusions to be drawn from the figures available The most remarkable feature of the case in question is that in the presence of these multiple and extensive lesions the patient should not only have lived to the age of 19, but should have led a comparatively normal existence, even to the extent of playing games such as football

I am indebted to Dr G Eric Lewis, physician to the Hull Royal Infirmary, for his help in the preparation of these notes

The Public Health Committee of the Middlesex County Council has submitted proposals for the extension and modernization of North Middlesex County Hospital The hospital, which at present accommodates some 1,370 patients, is used chiefly for acute, chronic, and maternity cases, and contains wards for mental cases It is estimated that the proposed scheme will cost £2,000,000

Reviews

DISEASE AT HIGH ALTITUDES

The Pathology of High Altitude Climate With Contributions to the Climatology of Highland Regions and to the Constitution of High Altitude Inhabitants By A Loewy and E Wittkower, M D Berlin, L R C P & S Ed (Pp 212 12s 6d net) London H Milford, Oxford University Press 1937

The authors have used the term pathology mainly to cover statistics of infectious and non infectious diseases There is no morbid anatomy or pure pathology in the book As the individuals dealt with spend all their lives at high altitudes they must be acclimatized, and therefore their climate cannot be considered a cause of any exceptionally drastic pathological change The highest altitude under observation is about 16,000 feet, but there is not much information from this level There is a fair amount of detail for La Paz, Bolivian Andes (12,350 feet) and a good deal of statistics from the highlands (mostly about 2,000 to 6,000 feet) of Switzerland, Spain, South Africa, and Central and South America The information at hand is, however, by no means complete, and the authors are to be congratulated on the careful and restrained manner in which they have drawn conclusions from their material Their own many researches were carried out mainly at Davos (about 5,000 feet), which under Professor Loewy has become well known as a research centre

Among points of special interest are the short stature, muscularity, relatively large chest circumference, and longevity of some of the highland races, Scots and Tyrolese are, however, tall At Davos the seated height is shortened in relation to the total height Generally speaking, the volume of air respired is increased, as are also the red blood cells and haemoglobin Residents acclimatized to any high level are liable to mountain sickness on proceeding 3,000 feet higher

With regard to statistics, the infectious diseases, with the exception of scarlet fever, are responsible for a large part of the total mortality at high altitudes The mortality rates for pneumonia are greater at these altitudes than in the lowlands Also there is an extraordinarily high mortality from acute intestinal diseases The total mortality for non European highlands (but not South Africa) is remarkably high compared with European highland regions (except parts of Spain)

The highland climate is of therapeutic value in certain defined cases We expect the authors are referring mainly to Davos and sanatoria at similar levels when they recommend this climate for patients of asthenic build, constitutional weakness, poor convalescence, post operative anaemias and those that occur after infectious diseases, bronchial (not cardiac) asthma and other allergic conditions, chronic bronchitis and pleurisies, Graves s disease, acne, impetigo, lupus vulgaris, all forms of tuberculosis of the bones, joints, and glands, and also for the first and second stages of pulmonary tuberculosis Dryness of the air is considered of importance for the last-mentioned In the Union of South Africa the mortality from all forms of tuberculosis is half to one-third of that of Central Europe—for example, Switzerland

The highland climate, such as that of Davos, is contraindicated in extensive pulmonary tuberculosis, in severe cases of intestinal and renal tuberculosis, and in cardiac insufficiencies Statistics do not always reveal the ill effects upon the heart, probably because

BRITISH MEDICAL JOURNAL

LONDON SATURDAY OCTOBER 30 1937

THE STAPHYLOCOCCI PATHOGENIC FOR MAN*

BY

JOSEPH W BIGGER, M D, Sc D, F R C.P I

Professor of Bacteriology and Preventive Medicine Trinity College Dublin

In my opinion the main function of a meeting of one of the specialized Sections such as that of pathology and bacteriology, held in connexion with an Annual Meeting of the British Medical Association is to act as a focus from which the laboratory worker may radiate knowledge of the recent developments in his special sphere and particularly of those which are of practical importance to his professional colleagues whether these be physicians surgeons or gynaecologists

My communication to-day is therefore designed to place at the disposal of the medical profession what I regard as the outstanding discoveries of the past fifteen years concerning the pathogenic staphylococci I have attempted not merely to predigest and to render both assimilable and palatable to those who are not specialists in the subject the enormous mass of literature which has grown up around the staphylococci but also to assess the practical importance of some of the many discoveries made during this period

For several years the staphylococci were my chief bacteriological hobby but for the past four years while still interested in these bacteria I have taken no active part in investigations concerning them In attempting to prepare this paper I first consulted that indispensable publication the *Quarterly Cumulative Index Medicus* in order to survey the field and I confess that I was appalled to find that in a very few years it had so much outgrown my knowledge of it

Almost the only good result of the great war was the impetus it gave to bacteriological research but during the war staphylococci were not much studied They never became a military problem as did the meningococcus the gonococcus the *Treponema pallidum* the enteric and dysentery bacilli and the anaerobic bacteria, presumably because staphylococcal infections were not noticeably more common among soldiers than among civilians So the war left the staphylococci as it found them and the immediately post-war textbook on bacteriology gave practically the same information about them as did its pre war predecessor But shortly after the end of the war staphylococci came into fashion for there are fashions in subjects of research and papers as in other things Just how popular these cocci have become among bacteriologists and those who apply bacteriology to clinical medicine may be appreciated by noting the number of entries relating to staphylococci in each of a series of years in the *Quarterly Cumulative Index Medicus* The number of references given were in 1921, 8 in 1926 43, in 1931 95 and in 1936 267

Before studying the development of our knowledge of the staphylococci since 1922 I must outline the field I hope to cover I propose to limit the field to the organisms which in 1914 were usually called the *Staphylococcus pyogenes aureus* and *Staphylococcus pyogenes albus* but which are I believe better grouped together as *Staphylococcus pyogenes* I do not propose to make further mention of the *Staphylococcus pyogenes citreus* in the existence of which as a pathogen I have little belief of the *Staphylococcus epidermidis* which may be either included in the species *Staphylococcus pyogenes* or disregarded as non pathogenic orof the *Micrococcus tetragenus* frequently considered as a staphylococcus

The Exotoxins

The pre war and immediately post-war bacteriologists realized the ubiquity and importance of the *aureus* and *albus* types of *Staphylococcus pyogenes* as human pathogens but devoted little time to studying them because they believed that everything of value was already known So far as one can judge from the textbooks of the period the staphylococci were believed to owe their pathogenic power to their endotoxins It was allowed that they produced such exotoxins as haemolysin first demonstrated on blood agar cultures by Kraus in 1900 and in filtrates of broth cultures by Neisser and Wechsberg in 1901 and leucocidin which was discovered by van de Velde in 1894 That these were true exotoxins was demonstrated by the capacity of animals treated with them to fabricate antilysin and antileucocidin but these toxins were not generally considered to play any important part in the pathogenicity of the organisms The existence of such soluble products of their metabolism as gelatinase which liquefied gelatin and a proteolytic enzyme which dissolved coagulated serum was recognized, but their importance was merely as bases of classification

The current views of that period on immunity to staphylococci were dominated by Wright and his school It was held that if there was in the circulating blood and tissue fluids a plentiful supply of opsonin the cocci were so transformed by it that phagocytosis actively occurred

* Read in opening a discussion in the Section of Pathology Bacteriology and Immunology at the Annual Meeting of the British Medical Association Belfast, 1937

and it is to be hoped that a movement in this direction will follow the present work In our opinion many of the new terms which have been adopted in the I N A are excellent, but for the nomenclature to be throughout generally acceptable and truly international it is highly desirable that in any future revision a close co-operation in all the preparatory stages should be obtained between specially qualified representatives of each of the different countries which participate in the work

CIRCULATORY FAILURE

Heart Failure By Arthur M Fishberg M D (Pp 788, 25 figures 40s) Henry Kimpton 1937

The essential factor in disease of the heart is its functional capacity, and in this book on heart failure Dr Fishberg contributes a review of present conceptions on the functional pathology and symptoms which is a masterpiece of compression and clarity It is a long book, but there is not a redundant sentence, a fact that will not surprise those familiar with the author s *Hypertension and Nephritis* Because cardiology becomes increasingly a study in abnormal function the monograph may be regarded as a textbook of heart disease of the best type A comparison with standard works of only ten or fifteen years ago shows how rapidly views on the mechanism of circulatory failure are altering and expanding Although at that time the prime importance of the state of the myocardium was appreciated, the arrhythmias and valve lesions were still given a prominent place To-day, in assessing the state of the heart, these conditions are regarded as still less important, and the tendency is to determine so far as possible the anatomical and functional alterations not merely in the organ as a whole but in the individual chambers

Views on the way in which the symptoms of heart failure are produced have altered radically in the last decade, largely as the result of studies on cardiac output, velocity of blood flow, venous pressure, vital capacity, and the circulating blood volume The bearing of these observations on the problems of the clinician are clearly explained by the author Shock or peripheral circulatory failure is usually of non-cardiac origin, but it occurs in some forms of heart disease and is rightly included in this book, especially as it is important that it be differentiated from heart failure, the treatment of the two conditions being in general diametrically opposed The therapeutics of heart failure proper occupy about one-sixth of the book No sounder or clearer review of all the important modern work on circulatory failure has been published

NURSING PRACTICE

A General Textbook of Nursing A Comprehensive Guide to the Final State Examinations By Evelyn C. Pearce (Pp 884 176 figures 15s net) London Faber and Faber 1937

The establishment of a State register of nurses has had wide effects Perhaps one of the most important has been the consequent change in the character of the training of the prospective nurse It is no longer enough for her to learn the duties of her future profession by oral methods, by observation, and by repeated trials and lengthy practice All these must still be done but it is now necessary that this knowledge and capacity should be so clearly arranged within her mind that on the fateful day of days of the final State examination she will be able to put down upon paper an intelligible answer to the questions set A born' nurse must now also be a knowledgeable nurse, hence the recent spate of textbooks designed to serve the needs of the probationer in her studies Of these *A General Textbook of Nursing* by Miss Evelyn Pearce, Sister-Tutor at the Middlesex Hospital, is without doubt one of the best As its subtitle indicates, it is "a comprehensive guide to the final State examinations," and in its eight hundred or so pages it gives as good, as clear, and as useful an account of the work of the nurse as we have read Miss Pearce in her introduction strives to impress this spirit upon her readers "The latest advances in medical science are brought to the bedside by the doctor, let the nurse see that her part is to provide, in full measure, the healing touch of human sympathy The smallest service done to the lowliest possesses an eternal value" And again "So much depends on the attitude of the nurse who receives the patient, since she by kindness and thoughtful sympathy can change the picture and dispel most of his fears'

In this same spirit the author has striven to put clearly and sympathetically before her readers pictures of the nurse's many-sided work It is obvious that she is trying (and successfully) to make the probationer see with her own well-trained eyes The character of the illustrations, of which there are many, is an indication of this endeavour Each section of the book contains photographic reproductions of the instruments, dressings, and other appliances needed by the visiting doctor for the examination, treatment, or dressing of the particular case, all of them clearly labelled and described The illustrations give in a most serviceable form a glimpse of the preparation of the ward, the theatre, or the examination-room

Miss Pearce is to be congratulated on her work It will be of good service to her junior colleagues

Notes on Books

The World of Science by F Sherwood Taylor, Ph D, B Sc (Heinemann, 8s 6d) contains 1,064 pages packed full of useful and interesting information about the mysterious universe in which we live The first part of the book, on states of matter, deals with such things as matter and energy, the patterns of atoms in solids, liquids, and gases In the second part, entitled "Power,' there are chapters on simple machines, electric currents, power, and loco motion Parts III and IV are devoted to "waves" and chemistry respectively, and, following the plan of the Book of Genesis, the author then proceeds via 'The Earth and Heavens" to a section on 'Life" In this last part of the book he gives, in just under a hundred pages, an admirably clear account of how the body works, and the information is remarkably up to date—no mean feat when the scope of the book is considered, covering, as it does, the whole field of science The 677 illustrations are well chosen and greatly assist the reader, the line drawings being especially well done. Altogether, this volume is a successful venture on the part of both author and publishers, and would make a welcome Christmas present to the young and also to the adult who still retains enough curiosity to want to know what it is all about

We have received a copy of the *Proceedings of the Paediatric Congress* organized by the Cuban Society of Paediatrics held at Santiago, Cuba from April 10 to 12 (Havana, Molina y Co) A large number of subjects were discussed, of which the principal were alkalosis, abdominal tumours, orbital cellulitis, diabetes, orthopaedic treatment of infantile paralysis, clinical examination of the endocrine system in children, the blood pressure between the ages of 6 and 12, and cerebral tumours in childhood A history of the Cuban Society of Paediatrics is prefixed to the volume

cases with little or no α toxin The toxin of bovine strains is predominantly β Morgan and Graydon (1936) produced evidence which suggests that α toxin is complex, consisting of at least two distinct toxins, α 1 and α 2

There is now general agreement that the α toxin is of greater importance in human disease than the β toxin, but until recently the identity or otherwise of one of these with leucocidin was in dispute Weld and Gunther (1931) believed that leucocidin was distinct from necrosing toxin, as also did Panton and Valentine (1932) Burnet and Freeman (1932) thought that the two were identical, and the conclusion of Wright (1936) was that α toxin and leucocidin were the same Valentine (1936) has cleared up the confusion by demonstrating that α toxin has a destructive action on rabbit leucocytes which had been used by some of the earlier investigators but practically none on human leucocytes and also that many strains of staphylococci produce a true leucocidin destructive for both human and rabbit leucocytes but without action on red cells Proom (1937) reported the important finding that the conditions necessary for the production of maximum yields of α toxin and of leucocidin are different

Burnet (1929) discovered that the toxin of staphylococci, like that of *B diphtheriae* could by treatment with formalin be converted into toxoid, which is non-toxic but acts antigenically in the same way as toxin, giving rise in inoculated animals to the production of antitoxin This, later, was found to be true of both the α and β toxins, although Dolman and Kitching (1935) point out that β toxin is more resistant to formalin than is α It is probable that leucocidin can also be toxoided

As a result of the labours of many workers we now have available the knowledge that staphylococci produce at least three toxins—α β and leucocidin—of which the first and last are of importance in relation to human disease, while the role of the β toxin is less certain that we can titrate the amount of antitoxins to these in the blood sera of men and animals whether normal infected or immunized that it is possible actively to immunize men and animals against these toxins and that for the treatment of human disease the antitoxic sera of immunized animals may be employed Some of the practical applications of these discoveries will be considered later

Attempts to Devise a Skin Test

A number of attempts have been made to devise a skin test comparable to the Schick test by which the immunity of the human subject to staphylococci or their products might be determined Among papers dealing with this subject those of Pilot and Afremow (1927) Hardenbergh and Schlotthauer (1927) Afremow and Pilot (1929), Panton Valentine and Dix (1931) and Bryce and Burnet (1932) deserve mention Most investigators have found that a large proportion of human beings give positive skin reactions following intradermal injection of staphylococcal toxin but it appears to be established that a positive response cannot be correlated with recent infections or freedom from these or with the amount of antitoxin in the serum It is possible that the confusion is due to the fact that positive results may be obtained in persons whose antitoxin level is low in respect of either the known or some as yet unknown toxins and also in those who as a result of past infections have become hypersensitive or allergic to the cocci and particularly as the work of Julianelle and Wieghard (1935) suggests to their protein constituents The first type of response would correspond to a positive Schick test the second to a positive tuberculin test That hypersensitivity may play an important part in the aetiology of staphylococcal lesions is suggested by the finding of Panton, Valentine and Dix (1931) that an animal repeatedly injected intradermally with staphylococci develops immunity, as is shown by a decrease in the size of the skin lesion caused by a measured dose of cocci, and also an increased sensitivity as is shown by the development of lesions after the introduction of one hundredth of the minimum dose of cocci capable of causing infection in a normal animal

Coagulase

One further soluble product of staphylococci remains to be mentioned This is coagulase, which causes the clotting of plasma and which is quite distinct from the toxins already considered Loeb (1903) first described the phenomenon which was more fully investigated by Much (1908) von Gonzenbach and Uemura (1916) and others The majority of pathogenic staphylococci coagulate rabbit plasma but many specimens of human plasma are resistant to coagulase This difference is probably to be explained by the presence of anticoagulase in many human bloods the result of frequent infections of man by staphylococci, whereas rabbits under natural conditions are but rarely infected At first sight coagulation of plasma would appear to be a useful defence mechanism for an animal infected with staphylococci, as it would tend to limit the spread of the organisms, and therefore that anti coagulase would conduce to a spread of infection This apparent failure of an immune substance to achieve its defensive purposes is explained by Gengou (1933) who suggested that coagulation of plasma is only the first effect of the so called coagulase Its main function, according to him is fibrinolytic, for which action preliminary fibrin formation or coagulation is of course necessary Anticoagulase, which in the test may prevent coagulation of plasma, in a staphylococcal lesion probably only slightly delays it, and later serves the useful purpose of holding up liquefaction until a defence barrier of polymorphonuclear leucocytes has collected around the site of invasion This view fits in well with clinical observation In the early stages of a boil the tissues appear to be hard and solid and then after a few days softening and liquefaction occur

The Opsonins

In reviewing the literature of the past fifteen years dealing with staphylococci the most surprising thing to me was the complete absence of any mention of opsonins a reference to which in pre war literature on the subject was a necessity The newer view appears to be Look after the toxins and the bacteria will be looked after The most enlightening paper I have read on this aspect of the subject is that of Downie (1937) This worker compared the effects of the introduction of living staphylococci into animals immunized against either staphylococcal toxins or staphylococci killed and repeatedly washed to free them from toxin In both cases as also in the case of normal animals the living cocci became surrounded by a zone rich in polymorphonuclear leucocytes but whereas in the normal or vaccine treated animals the leucocytes were inactive in phagocytosis in those immunized against toxin the leucocytes were actively phagocytic Furthermore necrosis of cells occurred in the case of the normal and vaccine treated animals but not in those treated with toxoid Injections of toxin in unprotected animals led to necrosis but not to the accumulation of leucocytes From this work it would appear that when the body whether immune or non

"HEALTH WITH HAPPINESS"

LORD HORDER'S SPEECH AT LEEDS

As part of the national health campaign Lord Horder addressed a meeting in Leeds Town Hall on October 15 The following is an abstract of his speech

Health Services The British Way

This campaign, this drive towards national health, begins by advertising our health services, services which I believe to be, *potentially* the best in the world They are so good that had they been conceived and constructed in Italy or Germany or Russia there would have been films and pictures and broadcasts long ago to tell the people what magnificent things were being offered and done on their behalf

As it is, being Great Britain, the health services have evolved gradually and quietly, and we have achieved a mass of benefits which, elsewhere, it has taken battles and murders and the subjection of personal liberty by dictators and executives to achieve But it is also British to clamour for reforms and then, when we have secured them, not to avail ourselves of them We have done this with the franchise, even the women have done it, and we have done it with the health services We retain our freedom to grouse, in this country we *can* grouse—and still live!

The Minister of Health is one of the most successful publicists and propagandists we have He 'made good" in another great Government Department, and I believe he will make good in his present job also If he does he deserves all the success that comes to him Although Sir Kingsley Wood would be the first to recognize that the magnitude of the two tasks is very different, I think the old adage, ' Blessed are the uses of advertisement, applies to them both

Propaganda for Fitness

When we come to consider what form the advertisement should take in the matter of making a fit nation, I agree with the Minister that he should first tell the people what they can get and how they can get it, and we should tell them through all the media that are available But it is vital that we make it extremely simple and that we eliminate all complications and duplications As I pointed out the other day, the health services are magnificent when viewed from the centre, but it is at the periphery also that we need energy and patience and a knowledge of the human material in order that this splendid machine shall get its benefits 'across"

When we have done our best to advertise the health services we shall give similar publicity to the new Advisory Council for Physical Training It is most important that these facilities be made the utmost use of There is a good deal of rather unfair criticism about the teaching of physical jerks to underfed citizens We must not forget that there are a lot of overfed citizens for whom some physical training would mean salvation, both of body and of mind Let us be fair The Minister of Health is making an advance on different fronts, and with different sorts of armament But the objective is the same The crusade assumes two things—the will to be fit and a modicum of intelligence If we sit sullenly at home when healthy recreation is offered out of doors, and we are the sort to benefit from it, we are performing an anti-social act, and if we take home a leaflet from the post-office on the rearing of babies when we haven t got any, we don t help ourselves to be fit—even though suggestion is sometimes a helpful form of treatment Everybody must choose the method of achieving fitness which is most applicable to his needs, and if he doesn t know which is most applicable he should ask the doctor The doctor cannot supply the *will to be fit*—though I don't want to limit his capacity even here—but he can supply the intelligence

A Ministry of Health that really functions as ours does, must claim the whole of a doctor s allegiance and all the energy that he can give to see that it functions 100 per cent But national fitness demands more than this Even if the present health services did function 100 per cent we should still be a long way off the attainable standard I am sure that the Minister of Health does not take so narrow a view of national fitness as that And I am equally sure that he would be surprised if I did not enlarge the field of inquiry and of suggestion in regard to this vital matter

A Working Definition

It is very difficult to define fitness, and yet we all recognize the fit man, woman, and child when we see them Certainly fitness cannot be measured by length of life I agree that the health services have been chiefly responsible for adding considerably to the expectation of life And the Prime Minister expressed this in a telling way, when he launched this health crusade, by saying that the length of life to-day is nineteen years longer than when he was born But, as I am frequently reminding people, this mere prolongation of life isn t fitness So far as a definition can be attempted fitness is health plus happiness, and neither of these is necessarily achieved by extending the duration of life I shall take it for granted that old age is not what we are aiming at, nor even sheer animal vigour The man who says ' Gosh! I m fit this morning,' is not expressing a satisfactory state of his muscles merely, nor even of his liver, he is expressing satisfaction with life That is the sort of fitness we want And that is the sort of fitness the statesman, rather than the politician, really desires for his country

Essential Ingredients of Health

The ingredients of optimum fitness are really very simple But we have so complicated our lives that we have mislaid some of them, and we must go back and pick them up again Some of them are really essential if we want to avail ourselves fully of our health services I have stated, and restated, these simple ingredients And yet I must risk boring you by repeating them Enough of the right food, shelter, which includes clothes and warmth, a job of work, access to the fresh air and such sun as our climate yields leisure for play of body and of mind—these are the essential things, concerning which there must be some feeling of security before the great advantages of our fine health services can be fully made use of

So far as my essential ingredients for health are concerned, it would be foolish for me, as a doctor, to pretend that Mrs Jones and her husband don t suffer from, say, indigestion because of worry—difficulty in getting enough food (let alone the right food), twopence more on the price of tea, and other anxieties—as much as from their ignorance of the health services or what sort of physical exercises are best It would be foolish And Dr Robinson, who is family friend as well as doctor, seeing Mrs Jones in his surgery, doesn't say *first* "You should make more use of the health services If he s a typical G.P he asks, rather grimly, ' Have the kiddies got enough to eat? Are you still spending money on that quack medicine or that patent food? Don t worry, Fred will soon get another job'—and so on *You* know well we *all* know But at the same time the Joneses are taxpayers, directly or indirectly, and the health services are not a charity, they are paid for by the country We must urge people to overcome their apathy and their hostility, and we must tell them exactly what is available

to an end a long-continued series of boils The advisability of investigation of sugar metabolism has already been mentioned Next comes active immunization, for which toxoid containing the three elements should be employed. At first the results of this treatment were controlled by estimations of the antitoxic titre of the serum, but it is doubtful if this is any more necessary than were estimations of the opsonic index in vaccine treatment It is now known that much higher values of antitoxin may be found in the serum of a person who has suffered from and continues to suffer from almost innumerable boils than in that of a person free from them The protective value of serum antitoxin against skin infections by staphylococci cannot be compared to the corresponding value of antitoxin as a protective against diphtheria But it may be taken as well established that even if the antitoxin content of the serum be high, it may be further increased even as much as five- to tenfold by active immunization, and that this may, and frequently will suffice to bring the infections to an end The most probable explanation is that susceptibility depends partly on antitoxin and partly on other factors, among which may be general metabolic peculiarities and peculiarities of the skin and its secretions The person who is susceptible to staphylococcal infections for the latter reasons requires for his protection a much higher level of serum antitoxin than does he who is naturally insusceptible As I indicated earlier I do not as yet feel inclined to abandon vaccines which may I think help to establish an antibacterial immunity just as toxoid does an antitoxic immunity I would therefore suggest the combination of toxoid and of autogenous vaccine in which the cocci have been washed free of toxin and toxoid It is as yet too early to be dogmatic about the number of injections or the total amount of toxoid to be used, but eight gradually increasing injections may as Dolman (1935) suggests be taken as a normal series, although obstinate cases may require twenty or more

The work of the past fifteen years has taught us much about the *Staphylococcus pyogenes* but it would be foolish to think that our knowledge is yet complete It has however gone far enough to show us how ignorant we formerly were and has most certainly improved the prognosis in the case of patients suffering from infections by this common organism

Bacterial Food Poisoning

No paper dealing with the pathogenic staphylococci would be complete without some reference to the role of these organisms in the causation of bacterial food poisoning The credit for the discovery goes rightly to Jordan who alone and with collaborators (Jordan 1930 and 1931 Jordan and Burrows 1934) published a number of papers on the subject Many strains of staphylococci isolated from both human and animal sources have been shown to elaborate in broth cultures grown under suitable conditions, a filterable fairly thermostable toxin which, when given by mouth to human volunteers or rhesus monkeys causes within a few hours nausea cramps violent vomiting, diarrhoea and prostration The incriminated food has usually been confectionery of some sort such as cake commonly with cream or custard filling The source of the organisms which have multiplied in the food and there formed their toxin appears to have been either the human skin or cow's milk It has not yet been decided whether only special strains of staphylococci produce this enterotoxin or whether the majority of staphylococci have the power, but in either case strains yielding this toxin have shown diversity as regards chromogenesis and other cultural properties The nature of the toxin is uncertain, but it is different from both the α and β toxins It is doubtful whether it is antigenic

Most records of staphylococcal food poisoning have come from America but there can be little doubt that such attacks which while unpleasant are never fatal occur also in the British Isles

As I have already said twenty years ago most bacteriologists believed that everything of importance in connexion with staphylococci was known, and yet the intervening years have been fruitful in fresh discoveries It is probable that similar intensive research in the case of other bacteria would yield equally unexpected and important discoveries

The new nurses home at Hackney Hospital Homerton, was opened on Friday October 15 by the Right Hon Herbert Morrison M.P., Leader of the London County Council It was in December 1934 that the Council decided to erect, at an estimated cost of £97,500 a new home for the nurses at Hackney Hospital At that time the accommodation besides being insufficient was scattered and very unsatisfactory The new building which has accommodation for 265 sisters and nurses is six storeys high fronting Sidney Road A training centre for nurses which includes a lecture room demonstration room and a library is also provided A flat roof over the greater part of the building affords facilities for sun bathing physical exercises, and other recreational purposes

BRITISH MEDICAL JOURNAL

SATURDAY OCTOBER 30 1937

THE IMMUNOLOGY OF STAPHYLOCOCCAL INFECTIONS

While it is useful from time to time to review any accumulated knowledge, it is particularly so when this has been acquired in a somewhat recondite sphere and yet has very general applications Few of those whose lot it is to treat staphylococcal infections almost every day can have been able to follow the manifold developments in the study of these infections during the past few years Hence the review by Professor J W Bigger, which appears on page 837 of this issue, is of particular value He traces, first, the causes which led to the neglect of this subject throughout a period during which other bacteria were receiving a full share of attention Although the operation of these causes is plain, it is perhaps still to be wondered at that nothing less than the Bundaberg disaster served to revive interest in toxins of which the existence had been known for almost thirty years During the whole of this time immunity in staphylococcal infections had been supposed to be anti-bacterial the effect of recent research is the belief that it is mainly antitoxic A supposed opsonin, which encourages phagocytosis, has given place to anti-leucocidin, which neutralizes a substance lethal to leucocytes, in the immune subject leucocytes are not so much stimulated to act as merely protected from destruction

With this intimate mechanism and with the properties and individuality of staphylococcal toxins few but interested bacteriologists will wish to concern themselves deeply The practical result of their study has been to furnish two new therapeutic weapons—antitoxin and toxoid Those who have given staphylococcus antitoxin a fair trial are mainly agreed that in grave and threatening infections it has undoubted value, in established septicaemia or pyaemia the task may be beyond its powers although the enormous doses recommended by enthusiasts such as Dolman are said to be effective even in these conditions Unless sulphanilamide fulfils hopes which are based at present only on experiment, antitoxin is the only specific remedy available for grave and acute staphylococcal infections The position of toxoid, which is used for active immunization in chronic infections, is somewhat different, since it has a rival in vaccines, which were almost universally employed for this purpose before the introduction of toxoid and still are The more amenable forms of chronic infection, such as boils and blepharitis, undoubtedly respond to either treatment, while the more resistant, such as sycosis, respond as a rule poorly to either But it is not to be concluded from this that two quite distinct methods of immunization are equally effective, because vaccines prepared in the ordinary way contain toxin as well as bacterial cells, and to prove that anti-bacterial immunity is sufficient in itself it is necessary to use a vaccine washed free of toxin When this has been done, as in the experiments of Kitching and Farrell,[1] vaccine has been shown to be inferior to toxoid as an immunizing agent On the other hand it seems scarcely justifiable to conclude that the bacterial element in the agent used is valueless, and there is much to be said for combined treatment with both One fact which has clearly emerged from a mass of clinical observations is that anti-haemolysin titrations are useless as a guide to treatment This antibody is readily estimated, but its concentration in the blood appears to bear so little relation to effective resistance that its behaviour is not a profitable object of study

A great deal more is certainly known about the mechanism of resistance to staphylococcal infection and treatment has become more rational and more effective, though how much more effective it is difficult to say But the study of individual toxins and the possibility of neutralizing them is far from laying bare the whole secret of staphylococcal pathogenicity Anyone who is tempted to think that these investigations have reached finality, and that mere improvement in the quality of toxin preparations is going to secure dependability in immunization, will do well to ponder two observations made by Forssman [2] In this author's studies of immunization the criterion of success has been protection against an intravenous dose of virulent culture which is regularly fatal in controls within twenty-two hours By no means whatever—whether with toxoid, vaccines, or with repeated doses of living culture—could he produce resistance to much more than ten times this minimum lethal dose When this limited effect is contrasted with what can be done with streptococci and pneumococci, to which animals can be made a million times more resistant, it is clear that some radical difference exists in the nature of the infections His other most significant observation is this Temporary recovery from the effects of intravenous inoculation with living culture is not accompanied by the immediate destruction of all the injected cocci, they may survive for days in the kidney

Jones and Tocantins, 1936	6 C		1	5
Davidson, 1937	3 C			3
Total	42		18	24

The parathyroid gland, because of its effect on the blood calcium, has also been involved Lowenburg and Ginsburg (1932, 1936) have reported two patients with thrombo

workers have failed to obtain any satisfactory result with venom (Davidson 1936–7, Lowenburg and Ginsburg, 1936 Jones and Tocantins, 1936)

cytopenic purpura who had failed to respond to treatment with venom and transfusions Following the production of hypercalcaemia with parathyroid injections all bleeding stopped In one instance the patient was perfectly well six weeks later but in neither case did the platelet count return to a figure higher than 290 000 per c mm at any time Mathewson and Cameron (1937) attempted to pro duce hypercalcaemia with injections of parathormone in one case without any success neither the platelets nor the blood calcium rose

Snake Venom

Peck and Rosenthal (1936) claim that repeated injections of moccasin snake venom are extremely successful (Table III) Venom is given subcutaneously In patients over 10 years old the initial injection is 0 4 c cm which is rapidly increased in subsequent injections to 0 8 or 1 c cm as a maximum dose This is usually given twice a week If symptoms are severe it is given every third day at least. Symptomatic improvement was obtained in seventeen chronic cases, but the platelet count was unchanged Four cases failed to improve and in eleven it was necessary to perform splenectomy or ligate the splenic artery Other

Blood Transfusion

Repeated small transfusions have been thought to accelerate recovery (McLean *et al* 1932 Jones and Tocantins 1933 1936) 300 c cm is regarded as the maximum dose in adults and is reduced considerably for children This should be given not less often than every five days and may be administered daily Jones and Tocantins (1936) have recently summarized their experience of treating twenty two patients with transfusions eight showed permanent improvement, seven temporary improvement and seven no improvement and they con clude therefore contrary to their former belief that transfusions are not always effective These are probably of greatest value in patients who refuse splenectomy or before operation in patients with severe haemorrhage

X-Ray Treatment

The application of x rays to the spleen has been advo cated by many observers (Table IV) (Stephan 1920 Bucky and Guggenheimer 1922 Gragert 1921, Hippe and Kochmann 1932) Many of the early case reports

this reason low fat diets have been recommended in psoriasis Rosen and his collaborators have attempted to test this theory by administering cholesterol to a series of psoriatic patients and a control group of normal individuals In contrast to previous workers they found that the effect of intake of cholesterol on the blood was extremely slight, and was much the same in both the psoriatic and the normal subjects Hence they conclude that this test affords no basis for the assumption that lipoid metabolism is disturbed in cases of psoriasis Lane and Crawford's statistical study confirms for the most part the generally accepted ideas on psoriasis A few points of difference may be mentioned For example, psoriasis is not supposed to be a pruritic disease, but they found pruritus present in about 33 per cent. of their patients With regard to the patients affected by the eruption they find that the arms are most frequently attacked This conclusion, of course, *will not be unexpected, but it is rather surprising to* learn that the scalp is more frequently the site of lesions than the legs In those patients who had taken arsenic no less than 40 per cent exhibited either reactions of intolerance or late unfortunate sequelae In view of the benefit to be derived from the use of arsenic they consider this is a high incidence of untoward effects Perhaps the most interesting point they have brought out is that five times as many patients were overweight than were below average weight for their age and height. Many know Kaposi's old dictum that psoriasis is a disease of the healthy It now appears that it should be rather described as a disease of the well nourished, and this observation also lends colour to the suggestion that in some obscure way the disease may be associated with a disturbance of fat or lipoid metabolism Of the many remedies used in the treatment of psoriasis injection of colloidal manganese was favoured by Moore[3] in 1922, but his results were not obtained by Gushue-Taylor[4] Oliver and Crawford[5] however now support Moore's observations and claim that in 20 per cent of their patients good results followed injection of colloidal manganese when combined with local measures

PATHOGENESIS OF OEDEMA

The term "oedema" originally applied to any swelling or tumour, has become nowadays restricted to an infiltration of the connective tissues with serous fluid, hydropsy of the connective tissues, with the exception of pulmonary oedema in which there is transudation of serous fluid into the alveoli of the lungs The appearance of oedema is often preceded by a dramatic and sudden increase of the patient's weight of eight to twelve pounds A test has been devised to determine the tendency of the tissues to oedema by injecting into the dermis one-fifth of a cubic centimetre of 4 per cent salt solution Ordinarily the small white elevation produced disappears in one to one and a half hours In patients dehydrated by vomiting diarrhoea or haemorrhage the time is much reduced (ten to twenty minutes) Professor Pierre Mauriac of Bordeaux who has made extensive studies of the literature and of his patients, from the mass of information thus obtained has been led to jot down some of the important points, hoping to guide others through the tangles and obscurities of the subject. He has succeeded in producing a useful little work[1] on the pathogenesis of oedema Even in cardiac oedema the transudation of fluids from the capillaries and small arterioles to the tissues is not the result of increased hydrostatic pressure alone there is always some associated affection of the liver and kidneys which tends to modify the proportion of proteins in the circulating blood and thus to affect the osmotic pressure attracting the fluid back into the vessels In renal disease the increased permeability of the glomeruli of the kidney due to toxins leads to loss of albumin from the blood and so affects the osmotic pressure more considerably but quite an amount of kidney substance may be damaged before symptoms of renal disease occur In renal disease another and more important factor is the retention of chlorides in the tissues, which thus tend to hold more water Since the time of Ranvier the effect of the nervous system on the transudation from the capillaries has been recognized depending on the sympathetic nervous system and occurring in general states of the nervous system hemiplegia hysteria, and in local conditions as in angio neurotic oedema and urticaria Mauriac postulates the intervention of endocrine influences in some cases of oedema not only in the oedema of cirrhosis of the liver but from ovarian factors in the oedemas of pregnancy and menstrual oedema An oedema of cachexia may occur in starvation in athreptic infants and in cancer oedema may follow operation and the explanation may be obscure Without coming to a decision on many points which in our present state of knowledge must be left for further work Professor Mauriac has drawn attention to many interesting problems on the metabolism of water in the body

PROPHYLAXIS OF TYPHUS

The prevention of typhus fever and vaccination against the disease form the subject of an important communication to the Health Section of the League of Nations, the introduction to which has been drawn up by Dr Biraud a member of the Section Dr Biraud relates that following an alarm concerning the presence of typhus among the troops in Madrid the Spanish Government asked the League for technical advice with the result that a mission of experts was sent to Spain among them Surgeon General Lasnet, formerly Director of the Health Services of Algeria Dr J Laigret of the Pasteur Institute of Tunis and author of a method of vaccination against typhus and Dr C Wroczynski formerly Director-General of Public Health in Poland The mission found that there was no typhus in Spain but that its occurrence was a definite menace because of the louse infestation of the troops the large number of refugees, and the possibilities of the virus being introduced from infected

Conclusions

It would appear, therefore, that the chance of curing a patient with thrombocytopenic purpura by the administration of ascorbic acid is, from the evidence at present available 33 1/3 per cent There is a rather higher chance that x rays may be of value—twenty five favourable reports against twenty unfavourable have been found Observations on snake venom therapy at present show eighteen patients benefited and twenty-four with no improvement There is no evidence that liver extract is of value Hypercalcaemia has been tried in too few cases to permit of any conclusion Transfusion has its greatest value in tiding an acute case over the preliminary stage and in pre-operative preparation Splenectomy to-day has an immediate mortality rate of 7 per cent or rather less and the majority of patients who recover from operation have a reasonable chance of permanent improvement

I am grateful to Professor F R. Fraser for permission to make use of his clinical notes and to Dr G Smith and Dr R G Macfarlane for supplies of vitamin P "citrin"

THE NERVOUS FACTOR IN JUVENILE ASTHMA

BY

A KERR CLARKSON, M B, Ch.B

An investigation of the known aetiological factors in asthma was undertaken in a large number of cases seen over a period of five years * The present paper briefly summarizes some of the observations made on the "nervous factor in 187 of those patients, whose ages ranged from 2 to 20 years

Evidence was early cumulative to show that the psychological element intruded in a varying degree in almost every case, and it was eventually possible to classify its relation to the syndrome according to three factors (1) the nature of the inheritance and environment (2) the degree of allergic thraldom (3) the duration of the condition

At an early stage of my investigation I was struck by the fact that a preliminary conversation with the parents of an asthmatic child could enable me to assess with surprising accuracy the measure of success which would attend treatment Further experience made it increasingly obvious that parental invasion of its psychic life could markedly influence the affective states of the child As Jung points out, the first form of a complex cannot be other than a parental complex because the parents are the first reality with which the child comes in contact" This is of supreme importance to our problem because as I shall later attempt to show allergy carries with it certain psychological limitations and the allergic child is often made aware of disordered emotional currents in its allergic parents and tends to fashion its own reactions in a preselected" imagery

What are the characteristics of those reactions and how are they related to the syndrome? It is only possible to answer those questions when psychological considerations are related to physiological data

Disturbance from Biochemical Changes

Analysis of the case histories under review shows that in the great majority the ideational pattern of the affective states is already deeply grooved in the nervous system prior to the onset of asthma Around a primary nucleus of fear is developed a diffuse background of "oversensitiveness" or apprehension Clinically this is evidenced by the fact that stimuli which impinge closely on the emotional life of these children appear to excite a diffuse wave of psychic radiation The normal reciprocal inhibition is hereditarily faulty The resultant loss of localization of stimuli widens the horizon of apprehension The decision about what is to be done becomes momentous the nature of the child's psychic endowment will be the ultimate guide to that decision A failure in adaptation or a tendency to false compensation will enhance a potential overflow into autonomic channels But, in my opinion at this early stage rarely can emotion pervert the machinery of the lower centres until something of a purely physical nature impairs the integrity of cortico thalamic control All the evidence suggests that this disturbance is brought about by biochemical changes ushered in by allergy In 98 per cent of my cases I have not been able to determine a purely psychogenic cause for the onset of asthma in the absence of other factors It must how-

* A Review of 300 Cases of Asthma in General Practice" (Sir Charles Hastings Prize 1936)

radical fashion than has hitherto been attempted So long as the importation of infected animals and the mixing of animals in open markets are permitted, and so long as financial assistance to encourage the farmer to rid his herd not only of diseased but also of infected animals is lacking, so long will any attempt to control tuberculosis in animals and contagious abortion be merely touching the fringe of the problem

SURGICAL APPROACH TO ENDOCRINE INSUFFICIENCY

Most investigators, in considering the syndrome of an endocrine hypofunction will in general associate it with a loss of power of the gland to synthesize the necessary hormone and refer this to some more or less defined structural defect But the demonstration of structural changes at necropsy is by no means a proof that the onset of the disease was due to such changes Although some cases may be the result of an original insufficiency of the secreting epithelium it seems probable, as pointed out by R Leriche,[1] that a more fruitful hypothesis is that the glandular elements do not receive in quantity or in quality the substrata necessary for their activity The problem of glandular insufficiency on such a view becomes one of vascular supply or of the composition of the supplied blood Such a hypothesis also opens the way for surgical attempts at reactivation Leriche, in the absence of full knowledge of all the factors concerned in endocrine activity lays down two objects of surgical approach (1) to discover if the circulatory activity of a gland can be increased by surgical intervention, and to observe if such an increase, when produced remains permanent and (2) to attempt, to influence the activity of an endocrine gland by modifications of the secretory or excretory activity of a gland in another situation He and his collaborators applied these ideas mainly in work upon the parathyroids It was found that removal of the upper part of the cervical sympathetic chain in the dog led to marked histological changes in the parathyroids In twenty-four hours after the operation there appeared a marked oedema between the sinusoidal capillaries and the parenchymatous cells followed by congestion and increased volume of the secreting cells, it was found that this state continued even after ten months Concluding from such findings that a state of increased activity in the glands had been established Leriche and his co-workers tried to produce clinically demonstrable effects by cervical sympathectomy in a child of 11 years who had severe tetany and pylorospasm and in whom the administration of calcium and parathormone had been of no avail Resection of the middle region of the cervical chain was carried out and the attacks of tetany disappeared so that two and a half years after the operation the child is developing normally and has had no further attacks The level of blood calcium is now over 10 mg per 100 c cm and hypocalcaemia has ceased to appear Two further cases of tetany similarly treated also did well The application of this method of re-activation of the parathyroids was extended to cases of polyarthritis, and results were obtained which strengthened the view held by Leriche that frequently these cases are really due to hypoparathyroidism On this hypothesis the benefits sometimes recorded as having resulted from removal of one of the parathyroids are attributable not to diminution of the amount of active parathyroid tissue but to the local hyperaemia produced by operation, since as often as not the tissue removed is not parathyroid but fat Leriche and his collaborators also claim to have benefited some cases of Paget's disease by ablation of the middle cervical ganglion The possible application of sympathectomy to cases of otosclerosis is also indicated by the good results obtained in fourteen cases at the Strasbourg clinic but it is considered that the effect was on the parathyroids rather than on the circulation in the ear How far similar measures would be useful in other glandular insufficiencies remains to be seen, but as the pituitary innervation is from the cervical sympathetic such procedures as removal of the superior cervical ganglion might perhaps be of value in those cases of pituitary insufficiency which are resistant to pituitrin or in cases of hypofunction of endocrines regulated by the pituitary The whole subject, as emphasized by Leriche, is in its infancy, but it will well repay investigation since it offers an attack on endocrine disorder in a way more fundamental than replacement therapy

[1] *Rev Chir* Paris 1937, 56 75

DEFORMITY OF THE DENTAL ARCHES

We have received from the Medical Research Council a report on investigations into the nature and characteristic features of post-normal occlusion[1] The work involved statistical consideration of a large number of measurements of selected samples of living children of different ages which the investigators hoped would settle the vexed question of superior protrusion or inferior retrusion as the important factor in the production of deformity of the dental arches In concluding their report the investigators say that "the main result of the investigations is to provide very suggestive if not conclusive evidence that the origin of inferior post normal occlusion in the great majority of boys but in a smaller proportion of the girls examined is essentially dependent on the degree of forward growth or the position of the upper jaw and not on retrusion of the mandible" The main point, indeed remains unsettled, but a well-conducted attempt has been made to approach it from a statistical standpoint

The late Lord Rutherford, O M was one of the surviving two Honorary Fellows of the Royal College of Physicians of London He received that distinction in 1928 at the time of the Harvey tercentenary in company with Lord Balfour, Professor Pavlov and Professor Wenckebach

[1] Special Report Series No 225 M R C Investigations into the Nature and Characteristic Features of Post Normal Occlusion By Matthew Young, Elsa Johnson Corisande Smyth and Mildred Still H M Stationery Office, 1937 (1s 6d net)

The knowledge of my helplessness makes me an anarchistic enemy of society These feelings are very real indeed to me at the time and yet when the attack is over and I think of them I realize how foolish they have been

In the course of evolution the flight of anticipatory ideas associated with emotion has been submitted to cortical control in the best interests of the individual It is difficult to believe that the evolutionary progress could ever have been maintained without this toning down of impulse and emotion by the higher centres In the asthmatic however, clinical experience seems to show that this modifying apparatus is in a state of maladjustment

All the evidence points to the fact that the allergic factor is principally responsible for the onset of juvenile asthma and that the psychic factor is either mobilized or intensified by allergic states This conclusion applies only to the early stages of the syndrome When, however, the condition has continued for some time diffuse psychical reactions centring around the organ inferiority emphasize the pre-existing emotional fears

Organ Inferiority

The potential asthmatic child enters the world with both a somatic and a psychic handicap Not merely may it be the victim of an active or passive sensitization from the mother, but of a chromosomal inheritance from the father It is born into a keenly competitive world and early environmental influences begin to impinge upon a highly receptive sensorium with invidious insistence Frequently it is the eldest or only child, and domestic pampering by parents often themselves the victims of allergic imbalance with its concomitant psychic reactions directs attention to physical insecurity Not infrequently the position in the family widens the scope for overprotection Moreover every other incidental illness is a source of anxiety since by increasing the sense of constitutional weakness it tends progressively to undermine confidence

In asthma frequent autonomic hyperirritability, initiated by allergy is an ideal soil for the formation of fear complexes (Emerson)

The direction of attention to the condition lends it emphasis Physical defects confer on the victim an aura of invalidism and the psychopathic thinking of his parents may surround him with an almost pathological limelight Attention becomes focused upon a subject which is daily discussed In any situation that is potentially dangerous, fear is present if attention is given to its dangerous aspects (Rivers)

Fortunately indeed for asthmatic children though the playing fields may terrify them their scholastic achievements are of no mean order About 73 per cent were far above the average and seven were dux of their school Of the remaining 27 per cent with one exception all were of average mentality and in the quiescent periods voracious readers More and more do they tend to seek the company of much younger or much older people and gradually acquire an outlook in life far in advance of their years It is sometimes alarming to find a child of 7 discuss its condition with the matured fluency of an adult They find an outlet for their latent energies in an endeavour to outstrip in the class room those with whom they cannot compete in the playing fields The feeling of inferiority and isolation demands a compensation and the time spent by other children in play is utilized by these patients in reading It is very rare to find a purely autistic attitude to life except in that very small percentage of cases in which asthma occurs in the course of a psychosis

The Conditioned Reflex

Once the experience of bronchospasm is sufficiently repeated there can be no doubt that it acquires all the characteristics of a conditioned reflex and at this stage the memory of previous analogous stimuli is adequate to evoke it and eventually is sufficient cause for its persistence

Once established as a conditioned reflex the potential catalysts, somatic and endopsychic become numerous indeed On the somatic side the activity of almost every organ under the control of the vegetative nervous system can eventually be the trigger of vago sympathetic imbalance Thus it is that a loaded rectum a swollen midturbinate, or a distended stomach may initiate a spasm Correspondingly, the diffuse ramifications in the psyche centralized around the primary emotional nucleus of fear may at any point lead to an attack This is of great importance from the prognostic standpoint In some long-standing cases the ideas clustered around asthma may come to colour the whole outlook on life In such cases future security is to be found only in analysis and sublimation

Emotional shocks that are final cannot be forgotten Many associations recall them' (Kretschmer) Every remembrance may be the occasion for the renewal of the original stimulus through a sensitized set of responsive neurones Not merely so but owing to the amazing psychical diffuseness associated agencies may touch the agitating spot Anything that will influence a sense organ is convertible into an affective stimulus This explains why artificial flowers may provoke an attack in a sensitized subject

Case 6—A brilliant girl aged 20 had suffered from asthma from the age of 2 years. The patient did not exhibit allied allergic conditions and physical therapy proved unsuccessful The possibility of a psychological cause was examined and the patient was analysed every day for five months and had asthma every night Eventually it was discovered by hypno analysis that the cause of her asthma was centred around the terrifying emotions of fear and suffocation when she was assaulted by a negro at the age of 2 The negro threatened that he would cut out her tongue if ever she mentioned the incident This ghastly experience had been completely repressed for eighteen years Despite this discovery and the explanation to the patient she was not cured for it was found by further analysis that the ramification of this early terror had permeated almost every sphere of psychic activity Her dreams were hypno-analysed for the next sixty-two days and every occasion revealed that the starting point of bronchospasm returned to the original agitating spot" Eventually the negro became replaced by a man with a black beard he in turn by a white man with a swarthy complexion At a later stage as confidence was gained the figure only attempted to frighten her without assault In the later stages a form of *sublimation was attained when* in the dream fiction she developed sufficient courage to kill her assailant Once this psychic conquest over fear had been attained her asthma ceased to recur

Ultimately dependent on the conditioned reflex there emerge three other characteristics which we may find in the course of the syndrome (1) purposive simulation, (2) hysterical habituation (3) voluntary reinforcement

Purposive Simulation

It must be recognized that in a considerable proportion of cases simulation by arbitrary reflex reinforcement is capable of development In my opinion this is most frequently determined by parental reactions The more

tongue is pressed forward with the left forefinger so that the airway drops into place it is non-traumatic, in spite of being made of metal This airway can be inserted

Waters Pharyngeal Airway

even when the jaws are in spasm (see above) if the left forefinger is used as a wedge behind the last molar tooth

LARYNGEAL SPASM AND STRIDOR

These are two degrees of the same reflex The appearance of either during induction shows that the anaesthetic vapour is too strong, or that particles of mucus are directly irritating the vocal cords Surgical stimulation, especially of the peritoneum or perineal region, will set up these reflexes if the depth of anaesthesia is insufficient to dull them A low-pitched stridor usually passes off as anaesthesia is deepened With a high-pitched stridor, however, the cords practically close during inspiration and the respiratory exchange is seriously reduced If, when all surgical intervention is stopped, the cords relax the anaesthetist may be able to regain control As a rule, however the reflex—once thoroughly irritated—is likely to recur at the slightest provocation, even though anaesthesia is subsequently maintained at a much deeper level than would have been necessary had it been adequate in the first instance

Intubation as a cure for laryngeal stridor is a confession of failure, but it is better to do this than to allow he respiratory obstruction to remain throughout the operation A tube a little stiffer and smaller than usual should be employed, and it should be introduced—in contrast to the normal practice—during expiration Intubation at too light a depth of anaesthesia may make matters worse for a time, as the patient may hold his breath and keep his chest rigid and immobile long enough for his circulation to become embarrassed While on the subject of intubation, I must add that the anaesthetist will save himself needless worry if he makes certain before the operation starts that the tube and connexions cannot come adrift, and that there is no chance of the patient biting through the tube The lumen of a soft tube can easily be obliterated by kinking or by pressure from a throat pack Finally, care must be taken not to introduce the tube so far that its end stretches beyond the bifurcation of the trachea into one bronchus

Primary Cardiac Failure

Although I have never seen the condition, many cases have been reported in which the combination of light anaesthesia and excess of adrenaline in the blood stream as a result of fear, excitement, or the introduction of the drug itself, together with the stimulation of operative intervention has resulted in ventricular fibrillation In my opinion the commonest cause of cardiac arrest under chloroform anaesthesia is a relative overdose following the sudden inspiration of a large quantity of the anaesthetic For example, this might occur during the deep breaths following a period of apnoea or shallow breathing, the deep breaths of the second stage of anaesthesia (especially if the heart is already embarrassed by some degree of asphyxia), and those following a cough or, if anaesthesia is incomplete, the first incision In such an emergency a child may be held up by his feet, or in the case of an adult the table may be tilted into the full Trendelenburg position at once Artificial respiration must be started by rhythmical squeezing of a bag filled with oxygen Local stimulation, in the form of hot cloths, may be applied to the praecordium If the patient's condition does not improve in a minute or two cardiac puncture through the third right intercostal space, followed by cardiac massage, must be resorted to, artificial respiration being carried on the whole time

Circulatory Depression

Collapse from cerebral anaemia may be brought about by a sudden change from the Trendelenburg to the horizontal position, or by allowing a patient who is deeply anaesthetized, or under the influence of a spinal anaesthetic, to be propped up Many factors embarrass the circulation and contribute to its exhaustion during operation The adoption of unnatural postures, the introduction of abdominal packs, the presence of respiratory obstruction, the inadequacy of the anaesthesia for the operative procedure in hand, the loss of muscle tone, the abolition of normal chest movements, and the toxic effects of the anaesthetic agent in prolonged deep anaesthesia, surgical trauma to muscle and nervous tissue, and loss of body temperature and fluids may all play a part in the production of shock It is a good practice to introduce rectal or subcutaneous salines throughout long operations which are known to be associated with shock A pause for recovery in the middle of a severe operation will often enable a patient to rally and then withstand a fresh onslaught The patient usually "compensates" for a time when haemorrhage occurs and circulatory failure sets in later if this compensation is overtaxed All degrees of circulatory depression are met with The onset of true shock is insidious, and the classical signs are well known If repeated observations of the blood pressure and pulse rate are made treatment can be started before this advanced state is reached, and results will be much more satisfactory

The table should be slightly tilted head downwards, the patency of the airway should be verified, and an adequate respiratory exchange kept up with an atmosphere rich in oxygen The lightest possible level of anaesthesia should be maintained—if an inadequate depth of anaesthesia was primarily responsible, it is too late to do any good by increasing the depth after the appearance of true shock A 5 per cent solution of glucose should be given intravenously in sufficient quantity to bring the systolic blood pressure up to 90 per cent of the patient s normal figure A blood transfusion may be advisable After operation the patient must be kept warm but not over heated Oxygen should be delivered at a rate of six to eight litres a minute through a nasal catheter, the perforated tip of which should protrude as deeply into the oropharynx as possible without giving rise to swallowing movements, this is especially indicated if there is any restlessness Although morphine by lowering metabolism, reduces the patient s requirements of oxygen, it also reduces his oxygen-intake by decreasing his respiratory exchange at the same time Unless the patient s need is urgent fluid is best introduced by mouth or rectum, because among other reasons, he can then reject any excess

Convulsions

"Jactitations under nitrous oxide are asphyxial in origin and call for the introduction of air or oxygen So-called 'ether' convulsions usually occur when the temperature is high in patients with some infection

ing effects in autonomic activity' and the first undue prolongation of the normal bronchiolar ripples may be registered in the psyche with a potency denied it at other times The autonomic centres may have freer play by the dulling of cortical consciousness Bray suggests that since a child may sleep through a 'wheezy' turn the psychological factor cannot play any part in its production In this connexion the following case is of interest

Case 11—A girl aged 5 had had asthma for three years and developed an attack which was alleged to have followed a reprimand at school The attack lasted for the remainder of the day, and the child was put to bed and fell asleep with the asthma unabated I saw her asleep the wheezing could be heard in the next room. Going quietly up to the child I whispered the suggestion that she would not awake that her breathing was becoming quiet and that she would pass into a normal restful sleep Similar suggestions were repeated at intervals of a minute The laboured respirations began to fade away the breathing became less audible and within ten minutes the spasm had completely abated and the child was sleeping peacefully

The relation of dreams to nocturnal asthma affords much valuable information in this respect Many psychologists believe that mental mechanisms may be manifested as a purely endopsychic autonomy while others subscribe to the view that their impetus and direction are initiated by physiogenic disturbance From my investigations I believe that in asthma both conditions may apply at different times Thus hypno analysis showed that in the early stages of treatment somatic disturbance usually stimulated the dream pattern In later stages the dream-fiction was more frequently endopsychic The reason for this fact may depend upon the progressive stabilization of the vago sympathetic balance Thus McDowell concludes that when the body is at rest vagus activity is maximal Pottinger asserts that potassium and to a lesser extent, sodium are associated with vagus activity whereas calcium is identified with sympathetic stimulation

Undue departures from normal values place the asthmatic in a potentially spastic state It is so frequently forgotten that cerebral tissue whereby the psyche is made manifest must correspondingly share in any biochemical disturbance It is therefore a diagnostic fallacy to look in the early stages of treatment except in a few cases for a purely insulated endopsychic interpretation Simon states If during sleep an organic apparatus is in a state of activity stimulation, or disturbance the dream will present ideas which correspond with the nature of the organic function performed by that apparatus

In asthma these stimuli are wont to travel along certain established paths Reaching the autonomic stations in the mid brain they are freed from the inhibitory influence of the cortico thalamic fibres A great deal more careful work requires to be done before we have positive evidence that the disinhibitory action of the higher centres in the asthmatic is dependent on a lack of synaptic buffering due to calcium deficiency but it would almost appear that some such interpretation is feasible The dreams associated with asthma are almost pre selected Whatever be the artistic imagery woven into them they frequently return to the agitating spot

Investigation of nocturnal attacks shows that they fall into three main groups (*a*) those of purely endopsychic origin (*b*) the expectation of an attack on going to bed (affective unrest) (*c*) the arousal of the dream pattern by somatic changes Hypno analysis of nearly a hundred dreams was carried out By this method it was believed that it might be possible to assess with extreme accuracy the onset and nature of the primary stimulus of the attack In many instances the fear of suffocation or strangling was woven into the dream pattern with amazing insistence

(*a*) ENDOPSYCHIC STIMULUS

Case 12—This patient's dream commenced at 2.15 a.m. and she states "I was in a long, dark room The windows were very small and high Cobwebs were everywhere The door was locked on the outside A man came from behind a piano in a corner He put his hands round my throat and began to choke me I struggled to escape I remembered I had a knife in my pocket I clutched it and wriggled round and stabbed him He fell to the floor dying. I rushed to the door and beat on it and shouted Everything seemed to go tight and taut I couldn't breathe I felt I was suffocating I couldn't get out I awoke with an attack of asthma Questioned as to somatic sensations the patient described that prior to the dream she was lying comfortably on her right side There was no visceral disturbance and no cough I interpret this having respect to all the factors of the case as a purely endopsychic stimulus

(*b*) AFFECTIVE UNREST

The 'occasion apparatus' suggested by Bleuler continues to function automatically once it is set in motion provided an adequate stimulus is supplied Many nocturnal attacks suggest that affective unrest on going to bed is apparently capable of determining the onset of an attack Adler suggests that

> This tendency is observed in early childhood where there is organic inferiority it is of excessive growth Very often this feeling occurs at the time immediately preceding sleep and then it is not remarkable that a dream fiction spurs further this effort of anticipation in a form to cause fear

The following dream is of interest

Case 13— I went to bed worried about the death of my sister I didn't sleep for a long time I fell asleep at 12.7 a.m. At 37 minutes after 1 I was conscious that my stomach seemed swollen I coughed twice and turned from my left side to lie on my back I remembered that coughing often brought on an attack I began to dream that I was alone in an empty house Plaster was falling from the walls The roof began to sink in I tried to escape but couldn't find a way out I heard my heart thumping louder and louder Breathing was difficult The dust made me cough more and more I was being suffocated and I awoke with asthma

(*c*) SOMATIC CHANGES

The following is a dream illustrative of these

> "I was aware that I was wheezing at 2.5 a.m. I began to dream that I was bathing in the sea I felt myself sinking and began to struggle My breathing was difficult and I felt myself choking I attempted to fight to the surface and woke sitting up in bed with asthma

Summary

Summarizing the psychic factor in juvenile asthma we may accept the following features as common in a varying degree to nearly every case

1 Intensification of emotion as an integral part of autonomic disharmony by allergic or biochemical factors

2 In a certain proportion of cases the psychological phenomena in asthma are entirely dependent on a disordered biochemistry

3 If the latter factor is not adequately treated there tends to be a perpetuation of an intense emotional life maximal when the allergic imbalance is upset and the establishment of an habituation reflex the primary nuclei of which are grouped around fear

glands after irradiation for carcinoma The series of fifty cases has now been completed, and the results are summarized in the following table

TABLE II—*Number of Cases Showing Cancer Cells 70 Days After Irradiation in the Breast and Axillary Glands (50 Cases)*

Total number of cases investigated	50
Carcinoma cells found in breast	34
„ not found in breast	16
Axillary glands palpable before irradiation	
Carcinoma cells found	15
„ not found	16
Axillary glands not palpable before irradiation	
Carcinoma cells found	10
not found	9

"Of the fifty specimens which have been studied histologically seventy days after irradiation, thirty four contain carcinoma cells, but it must be pointed out that in at least half of the positive cases the cells show signs of gross degeneration, and in many they look as though they were about to disintegrate and become absorbed In order to clear up this doubtful point it was decided to carry out a further series of investigations in which the tumour will be left for a period of six months before it is excised for histological examination Nine cases have been irradiated and one excised in this new series In addition to the radium series cases of advanced carcinoma treated by deep x rays are being similarly examined So far eleven cases have been recorded in this manner"

Cancer of the Cervix Uteri

The Birmingham General Hospital decided in 1936, after a trial of both methods, to adopt the Stockholm in preference to the Paris technique In principle the former is by three applications of 110 to 160 mg of radium element of fourteen to eighteen hours each, the latter by continuous irradiation by 67 mg for five days It was found that the Stockholm method was better tolerated by the patients, and was easier to manage from the nursing point of view It is hoped at a later period to give a comparative analysis of the results obtained by both methods

Since 1935 it has been the practice to give a full course of high-voltage *x* rays, beginning one month after the last Stockholm treatment From the diagnostic point of view parametric invasion is best detected by rectal examination, which has also been found valuable in assessing the limits of a cervical tumour Biopsy and bacterial examination are carried out in every case, in the former it is important that the operation should be one of avulsion rather than cutting, and it is essential that a portion of the endocervical region should be included in any section of suspected carcinoma of the cervix

Lacassagne's view that the general health of a patient when first seen only rarely furnishes a contraindication to radiotherapy is borne out by the experience of the Birmingham school as is also the view that the blood count—except for changes due to bacterial infection—is not a safe guide either to prognosis or treatment In support of this the details of an interesting case are given, which is so instructive that we quote it in full

The patient aged 52, was first seen in March, 1932, complaining of intermittent bleeding for a year very profuse for six weeks immediately before, recently the bleeding had been accompanied by considerable foul discharge The cervix was replaced by a high cavity with irregular friable walls extending as high as the internal os All fornices were obliterated but the cavity seemed to burrow rather more towards the right than the left The body was small and was anteverted and the walls were covered with fragments of necrotic material which had undergone mucous degeneration The general condition was very poor The blood count was red cells, 1 090,000 white cells 16 000, haemoglobin 13 per cent

A blood transfusion was given on March 21 1932, and on March 31 radium was introduced in accordance with the Paris technique—*that is 8 000 mg. hours* spread over five days The pathologist's report was Adenomatous tissues with irregular epithelial proliferation and many abnormal mitoses The appearances are those of a malignant adenoma showing *mucoid* degeneration By April 13 the blood count had risen to red cells, 2,940,000, white cells, 2 800, haemoglobin, 36 per cent.

The cavity in the cervix was much cleaner and all bleeding had stopped The general health improved, but by November 23, 1932, there was a large ulcer, with necrotic floor, on the cervix and involving the anterior vaginal wall A further dose identical with the first, was given, and after this progress was uninterrupted She was seen a week before the date of writing this report, and is in perfect good health with no sign of recurrence

As it had been found at the Marie Curie Hospital that after treatment of carcinoma of the cervix by radium later recurrences were usually situated high up in the pelvis, it was decided that external irradiation, by x rays or tele radium, was desirable either as a preliminary or a sequel to the intracavitary application of radium It is, however, only recently that facilities have been available for carrying this out The technique now adopted is to give preliminary *x*-ray therapy up to one half or two thirds of the dose which would be given if *x* rays alone were used The dosage given was approximately 2,000 *r* to 2,500 *r* at *10 cm depth* If the patient's condition is satisfactory this is followed by intracavitary radium, the dose under these conditions being from one half to two thirds of that normally applicable to the individual case

Although not enough time has elapsed to allow of a final opinion being given, the impression received has been that even these moderate preliminary doses of radiation produce more fibrotic contraction than is found when radium is given first, and that the contraction of the vaginal vault interferes with the efficient distribution of the radium Beyond this difficulty, the immediate results, as regards both the general condition and the state of the neoplasm itself, appear to be satisfactory

In all cases the *x*-ray therapy has been conducted by Coutard's low-intensity method In biopsy material taken after irradiation there was considerable diversity of effects Definite effects on cancer cells were observed in material removed during the second week of the low intensity x-radiation In later stages the predominant picture was one of advanced fibrosis with small islands of irradiated, but still probably viable, cells In a few cases there was only fibrotic tissue with occasional and doubtfully viable degenerated cancer cells The radiation was always arranged so as to give a calculated and even distribution throughout the pelvis External radiation appeared much less effective in cancer of the endocervix and corpus uteri, and curettage specimens removed after a dosage as high as could be tolerated showed actively growing carcinoma cells Cancer in these situations requires the local high intensity of dosage given only by intracavitary radium

Histological examinations of material removed at intervals during the course of radiation treatment has been a special feature of research at the Marie Curie Hospital Although the specimens taken are small, the information obtained from them provides an index of the effects of radiation on the tumour cells, and may serve as a guide to further treatment as regards both dosage and distribution For *instance, histological examination* of tissue removed from the cervix or vagina has sometimes demonstrated that the primary site was the corpus, although there was no clinical evidence that this was the case

Cancer of the Mouth, Nasopharynx, Larynx, and Oesophagus

The Birmingham General Hospital contributes a valuable and interesting report on these conditions With regard to the mouth, it was found that the best results were obtained when the buccal aspect of the cheek, the lip, and the palate were the site of growth the floor of

Comments

Considering the large amount of bromide ingested the blood bromide levels could not be regarded as being unusually high In fact in several cases—Nos 9 22 and 28—the levels were surprisingly low seeing that the patients had been taking 60 grains of bromide daily for seven ten and five years respectively In order to rule out any error the estimations were repeated and agreed each time and as has already been stated the chloride intake of all patients was fairly constant

When the blood bromide levels had been reduced to normal the patients mental states were re-examined No marked change was found and it was presumed that the deterioration was organic in type due to the epilepsy and did not appear to be increased by the bromide One patient (Case 21) spontaneously stated that she felt better and did not feel so dull and lethargic while the nurses in charge of several patients said that they were less sluggish and slow and did small tasks more readily than previously Where hallucinations and disorientation had been present before they still persisted, and in only two patients (Nos 5 and 12) were attacks of violence more marked One patient (No 11) who previously had frequent attacks of violence preceding his fits, had been much more docile since the bromide was discontinued Those patients who were paranoid before detoxication still remained so

Regarding the number of fits in three cases (Nos 2, 9, and 21) they have ceased altogether, and up to date—namely, six months since the bromide was discontinued—there has been no recurrence In two other cases (Nos 7 and 25) where there had been no fits for three months prior to the bromide being omitted there have been no fits since In none of these five cases have the patients become more irritable or difficult to manage

Of the remaining twenty-seven patients, ten showed a slight increase in the number of fits, eight a definite increase (of the minor type in some cases) five showed a decrease, and four remained as before In only a few cases where the fits showed a definite increase in number was it necessary to administer luminal to try and reduce their frequency and in no case did status epilepticus occur Various other drugs, such as prominal, benzedrine, amytal and ephedrine, were tried so as to reduce the number of fits, but with a varying degree of success

Conclusions

The blood bromides of thirty two chronic epileptic psychotic patients were estimated, and although comparatively high levels were found in many cases no obvious instances of true bromide intoxication showing delirious or confusional reactions were discovered

Reduction in the bromide level produced no appreciable change in the mental state, and no marked increase in the number of fits, which were definitely reduced in eight cases

We wish to thank Dr L H Wootton medical superintendent for permission to make use of the clinical material and also Mr N D Constantine technical assistant at the hospital for carrying out the estimations

At the annual general meeting of the People's League of Health with Dr C O Hawthorne the chairman of council presiding Miss Olga Nethersole presented the annual report The first national appeal launched by the League had realized some £5 000 A campaign for safe milk which was begun in February 1930 had been continued as had many other activities of the League Dr W G Savage moved and Sir Walter Langdon Brown seconded the adoption of the report Professor James Young proposed the re-election of members of the governing council and all official members of the League and Sir Frederick Hobday reported on the council's scheme for the eradication of tuberculosis from the herds of the country New members elected at the meeting to the medical council were Professor L S P Davidson Dr R G Gillespie Mr W T Munro Sir StClair Thomson Professor J A Ryle and Dr G Carmichael Low Sir Leonard Rogers was elected a member of the advisory council

F Sheppard chairman of the committee Their health was proposed by Dr P Watson-Williams, consulting surgeon to the ear nose, and throat department and Mr Eric Watson-Williams, surgeon in charge of that department, acted as honorary secretary of the celebrations

At the Royal Infirmary the guests had the opportunity of seeing not only recent improvements and installations, but also the historical treasures and records of the foundation Few hospitals have been as fortunate in their chroniclers Before the eighteenth century was out Richard Smith, a surgeon of the Infirmary, collected innumerable details about persons and things relating to its early years, and in more modern times another surgeon, Munro Smith, completed the account in a published history

The subscription list for the new Infirmary (the word "Royal" was a much later prefix) was opened on November 22, 1736, out-patients were attended first on June 30 of the following year, and in December the building was opened for in-patients, the opening taking the form of a service at St James's Church, attended by the mayor and corporation and the medical staff, followed by a royal dinner at the Nag s Head It is believed that it was the first provincial hospital in which in patients were received Their number in the first year was 194 and that of out-patients 234, contrasting with 10,300 and 70,500 respectively last year The first year's expenditure was £434, the annual expenditure is now £72 000 Two names specially associated with the beginning of the institution are those of John Elbridge, a controller of Customs, who erected and furnished the original building at his sole expense, and John Bonython, the first physician

Then and Now

At the banquet in celebration of the bicentenary a very interesting speech, historically flavoured was made by Professor A Rendle Short, senior surgeon to the Infirmary At the time the Infirmary was opened, he said, the condition of the sick poor in Bristol, as in other towns, was deplorable There was indeed a hospital (St Peter s), but it provided only for those who were very ill and also destitute, the generality of the sick poor merely had the services of apothecaries, often ignorant men, and these had to give their services almost gratuitously Then the medical men and business men of Bristol came together and blazed a trail

The hospital, of course, dated back to long before the days of chloroform anaesthesia Operations were then a formidable business They were, indeed, few and far between, and were reckoned great occasions One entry in the hospital records ran "Mr Richard Smith cut for stone in the presence of the Mayor and several gentlemen" Great advances like the introduction of chloroform were not welcomed with open arms Nearly every such advance saw the resignation of one or more members of the staff who could not adjust themselves to the new scheme of things A strange story was told, said Professor Short, of one of the first cases in which chloroform was administered at the Infirmary, when probably the anaesthetist, the surgeon, and the patient were equally terrified of the drug It was an operation on an adult for hare-lip The anaesthetic was given on a sponge, but there was not nearly enough of it, and the patient leapt from the table and raced round the building with the anaesthetist in pursuit Many more years elapsed before antiseptic methods were established In the surgeon's record book for 1875 was a dreary catalogue of operation after operation leading to disaster, blood poisoning sometimes following upon the most trivial procedures, and small wonder when the ligatures were pulled out of the pocket of a dirty dressing gown On the medical side, Professor Short continued the physicians of the Infirmary shared the views of their time A good deal of their treatment, especially in febrile cases was bleeding, cupping, and purgation Of J C Prichard, a great name on the honorary staff, a patient wrote

> 'He leaves his patients full of sorrow
> They re cupp d to-day and bled to morrow'

One physician used to prescribe as his favourite remedy cobwebs and the cellars of Bristol were scoured to provide them Infirmary dinners in the old days were rough affairs frequently ending in broken heads and bleeding noses and none dare attend them without a stout cane As for the nurses, it was related that a senior resident officer at one time had to stand in the lodge at night to see that the night nurse was sober enough to come on duty

Pioneer Work

Yet in such a school, said Professor Short, great pioneer work was done One servant of the Infirmary was Dr William Budd, who saw in the villages of Devonshire the way in which epidemics like typhoid fever spread, and recognized the particulate nature of infectious disease, thereby laying the foundation of modern epidemiology Another Bristol pioneer was Greig Smith one of the fathers of abdominal surgery Bristol remained abreast of modern developments, especially in team work It was not possible nowadays for a man to be highly proficient in every branch of medicine, but if the whole of those responsible for the medical service of a community worked together as a team there was enough skill and experience to provide absolutely first-class service in every branch To bring that about they in Bristol had a vision of one medical centre and one medical service, comprising alike the voluntary and the municipal hospitals, though this would take some time to achieve

Meanwhile the President, Colonel P G Robinson, described a more immediate project on the way to accomplishment—namely, the amalgamation of the Royal Infirmary with the Bristol General Hospital itself an old institution, though it cannot boast a double century He said that this fusion was one of the steps which had been made necessary if the best resources were to be available and the fullest use made of them He would not say whether the "marriage' was a love match or a marriage of convenience, or whether the Royal Infirmary was in the position of the wooer or the wooed but everyone concerned was confident of a happy outcome Those who had been in close touch with the arrangements necessary to bring about the amalgamation had been struck by the way in which individuals and groups had put aside private interests and had united to make the new order of things a success Some years might elapse before the full benefits of amalgamation were seen, but it was certain that they would be forthcoming in the shape of a more specialized and therefore a better service for the public

Historical Exhibition

A prominent feature of the reception by the Lord Mayor and Lady Mayoress (Councillor A F Moon and Miss Kathleen Moon) in the Bristol Museum and Art Gallery was an exhibition in Gallery VI of paintings, drawings, engravings, etc, of persons and buildings connected with the history of the Royal Infirmary This exhibition was arranged by the Museum and Art Gallery Committee and its director, Mr H W Maxwell Detailed labels were attached to the exhibits, and a historical note giving further particulars about the Infirmary was distributed with the programme One of the outstanding exhibits was a cup and saucer, part of a service made for Edmund Burke by his friend Richard Champion who was treasurer of the Infirmary and owner of the Bristol pottery where the famous Bristol china was made The exhibition remains open until to day, Saturday, October 30

At the close of the celebrations the President had the happiness to announce gifts totalling £3,550 from three benefactors

as the latter is too irritant Fifteen to twenty punctures are made with a triangular skin needle on the inner aspect of the lower part of the legs and the dorsum of the feet The needle is placed against the skin and quickly pressed into it and the point is pushed obliquely upwards into the subcutaneous tissue and withdrawn The whole movement should be done quite smartly, and is practically painless unless the needle is jabbed into the skin Veins can be felt and avoided, but bleeding if it occurs, is easily controlled by a little pressure Fluid will flow out from the punctures and collect in the receptacle placed under the feet In male patients the scrotum should be supported by means of a folded bed sheet placed across the thighs, this will help to reduce the size of the distended organ and render puncture of it unnecessary If the ascites tends to diminish rapidly it is advisable to apply an abdominal binder as after paracentesis Light massage of the limbs may be employed to promote drainage and overcome the stiffness of joints When it is decided to stop the drainage all that is necessary is to put the patient to bed and wrap the legs and feet in an absorbent dressing for two or three days while some oozing from the punctures remains

Summary

1 Mechanical removal of oedema fluid by acupuncture is a useful addition to the therapeutic measures available for the treatment of obstinate oedema

2 This method possesses several advantages over the use of Southey's tubes

3 Certain precautions are necessary to avoid complications these are stressed

Clinical Memoranda

Tricuspid Stenosis and Pulmonary Tuberculosis

A combination of pulmonary tuberculosis and a congenital heart lesion is sufficiently unusual to make it worth while recording the following case

A youth aged 19 was admitted to the Hull Royal Infirmary on April 3 1937 on account of a severe haemoptysis There had been numerous smaller haemorrhages during the previous year but he had paid little attention to them He suffered from a slight cough

He was born during an air raid and was three months premature He had always been rather blue in the face and at the age of 13 had been diagnosed as a case of congenital heart disease At that time he was not expected to live much longer The patient, however was very cheerful and refused to lead a life of invalidism He actually played football till quite shortly before his admission There was no history of any illness suggesting rheumatic fever or bacterial endocarditis

On admission the patient's temperature was 97 , with an evening rise to 99 , pulse rapid but of good volume respirations 24 per minute His cheeks and lips were very cyanosed while the fingers showed marked clubbing. The apex beat of the heart was in the anterior axillary line in the sixth space The sounds were heard loudly all over the chest and there was a diastolic murmur with a presystolic crescendo audible particularly well over the mitral area The percussion note was resonant all over the lungs but the breath sounds were faint No clinical evidence of pulmonary tuberculosis was discovered although he was examined carefully several times No other abnormal signs were elicited Three days after admission the patient had a further large haemoptysis and died

Post mortem examination revealed evidence of active tuberculosis at the apices of both lungs which contained several small cavities with ragged walls The pleura in these situations was thickened and adherent. The bronchi and trachea contained much fresh blood and the tracheo bronchial glands were enlarged The heart also was grossly enlarged particularly the right side which was much thicker than the left The tricuspid valve was stenosed and incompetent being covered with numerous firm granulations but all the other valves were quite normal There was a patent foramen ovale which admitted the tip of the little finger with ease The spleen was three times larger than normal but all the other viscera appeared natural except for congestion

Discussion

Congenital tricuspid stenosis is a very rare abnormality and when present is usually associated with pulmonary stenosis and/or a patent foramen ovale Although in this case the history suggested that the condition was in the nature of a congenital malformation the presence of granulations indicates that it must almost certainly have been of inflammatory origin and reference to the literature on this subject shows that it is so in a large proportion of the reported cases Thus in the sixteen cases collected by Rachfuss (cf Osler and McCrae 1927) five were due to imperfect development five were definitely inflammatory and six were of doubtful origin

A persistent communication between the auricles is relatively common the figures varying between 30 5 per cent. (Herxheimer) to 1 5 per cent (Adami) (Rokitansky 1855) but the opening is usually only in the form of a valvular slit and a definite foramen is much rarer It has been suggested that a cause of the patency may be a rise of

Zealand The College had added to its select company of Honorary Fellows Mahfouz Pasha of Cairo, and Dr George Gray Ward of New York whom they welcomed that evening Among the honours received by Fellows Sir Ewen referred in particular to the presidency of the British Medical Association, now held by Professor R J Johnstone, and the distinctions conferred by the King on Sir Harold Beckwith Whitehouse and Mr William Gilliatt Lastly he mentioned the co operation of the Central Midwives Board in the investigation into analgesia in midwifery, the link between them being Sir Comyns Berkeley the work of Mr Donald Roy, as librarian and secretary of the College at its headquarters in Queen Anne Street, and the services to the library of Dr Arnold Chaplin Harveian Librarian of the Royal College of Physicians

Mr EARDLEY HOLLAND proposing the health of the guests welcomed twelve presidents of sister colleges and societies, who included Sir Cuthbert Wallace P R C S Eng, Dr W T Ritchie, P R C.P Ed, and Miss Louisa Martindale President of the International Medical Women s Federation He said that the College had enjoyed throughout the friendship and support of Lord Dawson and Sir Cuthbert Wallace, and that of Lord Horder who had been its adviser from the beginning Lord HORDER in a brief reply, said that all the guests, with their varied outlooks and interests were united as well-wishers of the College Sir GEORGE CHRYSTAL Secretary of the Ministry of Health, who also responded to the toast spoke of his long acquaintance with doctors during his career at the Ministry of Pensions and the respect and admiration he felt for the work of the medical profession The Ministry of Health recognized the enormous advances made in obstetrics and gynaecology since the bad old days and knew it could rely on the help of the College in dealing with the problems of this restless age

Reports of Societies

THE FUTURE OF PHYSICAL MEDICINE

At the meeting of the Section of Physical Medicine of the Royal Society of Medicine on October 15, Dr F D HOWITT in a brief presidential address, said that as long as the view was allowed to exist that physical medicine was purely a treatment specialty its status must remain ancillary to medicine No one sent a case to a dermatologist with the request for the application of a certain ointment, or to a cardiologist for the prescription of a certain drug It was the duty of the physician whatever his specialty, to examine the patient from every aspect, to review the remedies at his disposal, and to prescribe and alter his treatment according to the reactions which took place There was an army of qualified technicians thoroughly competent to carry out electrical, hydrological and gymnastic prescriptions ordered by medical men, and they faithfully kept within the boundaries of their status The application of physical treatment was the province of these technicians, the prescription was the province of the physician It was not helpful to the prestige of physical medicine to suggest that the technical application of treatments was a matter of great difficulty, although the correct selection and prescription required a wide and comprehensive knowledge, not only of physiotherapy but of clinical medicine Physical treatments were no more their monopoly than was the blood pressure apparatus the monopoly of the cardiologist or the knee-jerk hammer that of the neurologist But in difficult cases the opinion of the expert must be sought and it was the duty of the leaders and investigators of physical medicine to direct and advise upon the various methods which might most advantageously be employed

Dr Howitt also touched on the systematized teaching of physical medicine Certain of the Examination Boards now recognized the subject officially, but little provision was as yet made for it in their teaching syllabus or examination papers, with the result that the young doctor went into practice and was immediately confronted by a demand for physical treatments in which he had no training or experience whatever It was a pity that the demand for physical treatments had come so forcibly from the lay public before the profession had had time to train its members efficiently The result had been that the practitioner had been faced with the ignominious dilemma of either ordering electrical or radiation treatments to be carried out by a qualified masseuse or of installing apparatus himself without having learned even the rudimentary principles The student must be instructed in the prescription of physical treatments as a matter of precision, such prescription only to be made after an exhaustive review of the clinical condition, the findings with the various aids to correct diagnosis and in conjunction with such specific remedies as the nature of the individual case demanded Lastly the student must be instructed in the correct assessment of the importance of psychology, both in the aetiology of chronic ill health and also in its particular influence in physiotherapy He concluded with a remark of the late Sir Alfred Fripp that the student in the choice of his career might decide either to be a big fish in a little pool or a little fish in a big pool, Physical medicine was a big pool, constantly replenished from many streams it was a pity, with such opportunities, to remain in the shallow waters of restricted endeavour

Sir ROBERT STANTON WOODS said that there were physical agents which either had been so long in use or were so well understood that their administration might with safety be entrusted to the technician and at any rate without fear of active harm, be prescribed by the majority of medical men but there were others which, perhaps from newness were potentially dangerous and therefore needed the control of special skill or of such experience as their novelty permitted With it all the mental outlook must be based broadly upon a knowledge of medicine Dr C W BUCKLEY agreed with the President that the foundation of physical medicine must be a sound clinical training Unless a man was a good physician he was likely to be an indifferent practitioner in the specialty he represented

Dr C B HEALD touched on the question of a post graduate diploma He had doubted whether this was feasible, partly because he could not see a suitable ring fence round the syllabus, and partly because the lack of keenness in the subject made him wonder from what source the potential panel of examiners would come But if the Section decided that it was its business to sponsor on the medical side the new national move for the assessment of physical welfare and physical education, not only would it be possible to make the syllabus of the postgraduate diploma of real value, but a field of new recruits would be opened up Recruits for whom a diploma in physical medicine would be valuable were examiners for insurance companies, medical officers for schools medical officers of the services associated with recruiting and medical officers in firms concerned with over-sea personnel or employees welfare

Dr F G THOMSON said that, while there were certain physicians who practised physical medicine and certain surgeons who practised what might be called physical surgery the general physician and surgeon had the most elementary knowledge of what was required, and though he might send his patient to someone representing one or other branch of physical medicine yet if one branch only were practised the criticism would be made at once that practitioners of physical medicine treated all diseases by the same method Dr G B BATTEN mentioned the need for research If as much research had been done in physical medicine especially in bio electrology as had been done in radiology the position would be very different

other diseases often terminate life and these latter not the former are stated in the records There is some discussion over the cardiac effects and this would have been aided by fuller reference to the extensive animal experiments which have been carried out under oxygen pressures lower than those which exist at the altitudes considered It is obvious that in such a case full information of what is really happening can only be obtained with the aid of animal experiment in which the severity of the conditions is somewhat increased the pathological effects are then more easily revealed and suspicion that the heart is at a disadvantage becomes certainty

The arrangement of the book is neat and handy and the information will be of great use for future reference

DEXTROSE THERAPY

Dextrose Therapy in Everyday Practice A Survey of the Literature 1900 1936 on the Experimental and Clinical Studies Applicable to Medicine and Surgery By E Martin Sc D With forewords by W N Haworth F R S and Bernard Fantus M D (Pp 451 44 illustrations 3 dollars) New York and London Paul B Hoeber Inc 1937

In this book an attempt has been made to survey dextrose therapy from all its aspects The author begins with a short account of the chemistry of dextrose This is followed by a review of the physiological role of this substance and then the author discusses both the theoretical and practical bases for the use of dextrose in diseases involving each system of the body Finally an account is given of the various methods of administration References in profusion are quoted in each section

The discussion of the chemistry of dextrose is lucid and brief and it is clear that in this field Dr Martin understands his subject but it is impossible to read the rest of the book without receiving the impression that the author has only a second hand or at most a superficial acquaintance with the conditions he discusses Perhaps the desire to make the work comprehensive accounts for the uncritical accumulation and discussion of references but it hardly accounts for the correlations which have been made It is disconcerting to find the action of pituitrin on carbohydrate metabolism contrasted with the effects of hypophysectomy and no mention made of the action of the diabetogenic hormones of the anterior pituitary gland How it is possible to read over 2 000 references concerning the role of dextrose in the body without encountering the numerous publications of Houssay and his colleagues concerning the action of the anterior hypophysis or the work of Verzar in connexion with the absorption of glucose, is a matter for speculation

The most serious fault of this book however is its lack of proportion In an attempt to ascribe importance to dextrose in so many diseases the author has ransacked the literature for evidence in support of his conviction The result is that a largely erroneous idea is given of many conditions in which dextrose is concerned either secondarily or not at all In the discussion of dehydration Addison's disease stoker's cramp alkalosis intestinal obstruction and shock justification of dextrose therapy involves such special pleading that the fundamental pathology of these conditions is obscured and attention distracted from essential therapeutics

It is difficult to see to what type of reader the book can be of use To the student it will be rendered obscure by the mass of references and the failure to indicate which work is good which bad and which trivial to the practitioner the absence of precise instructions when and where to do what in the relatively rare conditions it describes will rob it of most of its useful claims to the specialist whether physiologist or clinician the errors in the book will appear so numerous as to debar it from serious consideration

ANATOMICAL NOMENCLATURE

Die Nomina Anatomica des Jahres 1895 (B N A) nach der Buchstabenreiche geordnet und gegenübergestellt den Nomina Anatomica des Jahres 1935 (I N A) By Dr Fr Kopsch (Pp 103 M 2.50) Leipzig Georg Thieme 1937

In this treatise the nomina anatomica of 1895 (B N A) are arranged alphabetically and placed opposite the nomina anatomica of 1935 (I N A) After forty years the Basle *Nomina Anatomica* has been amended and brought up to date certain new names have been added and others omitted We owe to Professor Kopsch and his collaborators this clear and concise comparison of the new with the older nomenclature which enables the reader to see at a glance the numerous alterations that have been adopted Asterisks and double asterisks have been employed to denote respectively minor and major alterations These are chiefly concerned with (1) linguistic corrections (2) substitution of such terms as "cephalic or caudal for superior or inferior" (3) the elimination of names of individuals with the exception of certain celebrities of classical renown who for the time have escaped the axe—for example Achilles Burdach Goll Gowers and Flechsig whose names enclosed in brackets follow the descriptive term Thus tendo m tricipitis surae (Achillis) The fresh names belong chiefly to the nervous system and include those of many of the nerve tracts which have come into common use since the publication of the B N A in 1895 These names now indicate besides the position of the tract the direction in which nerve impulses are conveyed Moreover the nuclei of nerves receiving afferent fibres are distinguished from the nuclei of origin of efferent fibres Thus the N terminalis nervi trigemini is distinguished from the N originis nervi trigemini Also the long overdue change with respect to the name N acusticus has now been accomplished and it is called the N statoacusticus and the otoconia and maculae acusticae are termed 'statoconia and maculae staticae

Some changes however we think will not meet with universal approval In some cases the craze for obtaining absolute uniformity has led to obscurity in meaning or to quite unnecessary alterations For instance the vertical and horizontal parts of the palate bone have respectively been rendered lamina palatina and lamina maxillaris We also note that the cumbersome and incorrect name epistropheus for the axis vertebra has been retained notwithstanding the criticisms which were made in 1895 The Greek word *επιστροφεύς* signifies the object which is turned rather than the pivot around which the movement takes place hence rightly, the first vertebra of the neck The name *επιστροφή* denotes a wheeling or turning movement such as is made in military exercises Some alterations which are not actually incorrect are nevertheless awkward and not likely to be generally adopted—for example in place of the comprehensive term tunica vaginalis testis the double name periorchium + epiorchium is suggested

Incidentally it may be mentioned that the I N A nomenclature is limited with few exceptions to the gross anatomy of the human subject, names applying to microscopical structure and embryology being excluded There is however a distinct need for accuracy and unanimity with respect to these two branches of human anatomy

of one type into those of another In each single epidemic certain types predominated—for example, in one epidemic the lethargic ophthalmoplegic type prevailed, in another the bulbar paralytic, amyostatic, or hyperkinetic These might seem to be different diseases were it not for their simultaneous appearance in one and the same epidemic In spite of the protean aspect of encephalitis lethargica there was overwhelming evidence from the clinical, pathological, and epidemiological standpoints that it was an independent disease, and distinguishable from the other forms of epidemic encephalitis which were occurring and which were being identified

The disease had been notifiable in England and Wales since 1919 The year of highest incidence was 1924, when 5,039 cases were notified with 1,407 deaths Since that year the incidence had gradually declined, and from 1930 onwards the deaths as aftermaths of the severe epidemic incidence had exceeded the notifications In 1936 269 cases were notified and there were 686 deaths The epidemiologist could not dogmatize upon the future behaviour of this malady He could only hope that the declining incidence meant that it would become rare enough again to disappear from the records

THE CONTRIBUTION OF ADLER TO PSYCHOLOGICAL MEDICINE

The Medical Society of Individual Psychology held its inaugural meeting of the session on October 14 The Society s programme for the winter includes a symposium on the contribution of Alfred Adler (who died last June) to psychological medicine This will take the form of four papers, the first of which was read by Dr H C Squires on October 14 The other three will be "Organ Inferiority, by Dr Cuthbert Dukes on November 11, "The Contribution of Adler to General Medicine," by Sir Walter Langdon-Brown, on December 9, and "The Relation of the Sexes," by Dr O H Woodcock on February 10, 1938

In his address Dr H C SQUIRES after drawing a picture of Adler s impressive personality as an original thinker, an uncompromising fighter, a dominant leader, a wise and sympathetic teacher with a ready wit and a keen and discerning flair, referred briefly to the circumstances of his day and generation Pre-war complacency in medicine had given way to many spectacular advances, especially in the domains of biochemistry and psychology, and in psychological medicine attempts were now being made to consolidate the positions won and to secure where necessary modifications in their alignment Psychological medicine seemed to be aiming not so much at a correlation of the views of the founders of the three main schools of psychological thought as at an attempt to create a presentation that was more comprehensive than any one of them Adler s contribution on the theoretical side was a study of the personality as a purposive, controlling activity On the question of treatment Adler always stated that his objective was the increase of social interest in the individual It was emphasized that the effective use of such a method was an art that could only be acquired by different individuals in different degrees Adler regarded dreams as a symbolic representation of problems which the individual felt inadequate to solve in a realistic fashion, and he laid stress upon the importance of the effect or feeling that the dreams might generate In respect to the prevention of neurosis and delinquency, Adler advocated co-operation with the teaching profession for the recognition of potentially neurotic and delinquent children who could then by appropriate treatment be helped towards a socially adjusted life

Adler had been adversely criticized for popularizing psychology He certainly believed that the approach to life problems that he had to offer was in the nature of an educative process, in which many could participate—especially members of those professions and callings which were concerned mainly with the human element But he would have the medical profession, as the guardian of the public health, control medical treatment in all its forms, though at the same time it should not disdain the help that others outside the profession could give in an ordered and prescribed fashion

HEALTH AND EXERCISE

At the first meeting of the session of the West London Medico Chirurgical Society, held at the West London Hospital on October 8, Dr D G RICE-OXLEY in a presidential address on health and exercise, said that the object of physical culture was to maintain a high standard of physical and mental efficiency To this end games were important, but they were, after all, only the specialized ends of physical training and the proper development of the body The basis of physical education was to train the body to acquire correct carriage when standing or sitting, good style in running and walking, and the habit of correct breathing, while modern physical exercises aimed at producing normal mobility, strength, control, and agility Dr Rice-Oxley spoke in particular of the importance of maintaining the normal mobility of the back Reduced mobility was the beginning of deformity which led to ill-health The real strength lay in the muscles of the trunk, and not of the limbs, especially in the condition of the large muscles of the back and abdomen, and many of these deformities were due to the fact that in the past physical training tended to develop arms shoulders, and legs at the expense of the development of the back, which had been injured by burdens to which the limbs subjected it

ENGLAND AND WALES

Chelsea Clinical Society

The annual dinner of the Chelsea Clinical Society was held at the Rembrandt Hotel on October 19, under the presidency of Dr T A Butcher The toast of "The Society, with which was coupled the name of the president, was proposed by the guest of honour, the Earl of Athlone Lord Athlone sketched briefly the history of the society, which was founded in 1897 by the general practitioners of Chelsea Its meetings were held at a general dispensary and there were only thirty four members Since that time the influence and the prestige of the society had grown steadily, and its membership was now over 200 In replying to the toast Dr Butcher pointed out that this was perhaps the first time in the history of the society that they had had the privilege of entertaining at one and the same time the Chancellor, the Principal and the Member of Parliament for London University He gave some account of the activities of the society at its monthly dinner-meetings, at which discussions were held on all aspects of medicine The programme for the coming session included topics as diverse as medicine and surgery in ancient Egypt and modern methods of crime detection Dr Butcher paid tribute to the work of the two secretaries, Mr A Rugg Gunn and Mr H Paxton Baylis, and to Dr K E Eckenstein, who had been treasurer for a period of twenty six years He then presented Dr Eckenstein with a silver cigarette box as a token of the society s esteem Dr Eckenstein responded briefly and thanked the president and the society for their good wishes The toast of The Guests was proposed by Mr F J McCann, who

Preparations and Appliances

THE MULTIPLE SEDIMENTOMETER

Dr TERENCE LEE (London S W 18) writes Since the publica tion of my article on the sedimentometer (*British Medical Journal* 1936 2 809) the manufacturers have produced a satisfactory type of multiple tube sedimentometer (Fig 1) The working principles of this new apparatus are unchanged in that an image of each tube is focused through a vertical slot on to a moving light sensitive surface The advantages of the single tube machine are thus retained and the meniscus is seen as a thin white line above the millimetre graduations on the tubes are recorded and however fast the sedimentation rate the margin between the supernatant plasma layer and the settling red cell layer below is always sharply defined Furthermore the mechanical parts (stage motor etc) are essentially the same The apparatus thus retains its com pactness, while economy has been achieved in the cost of production

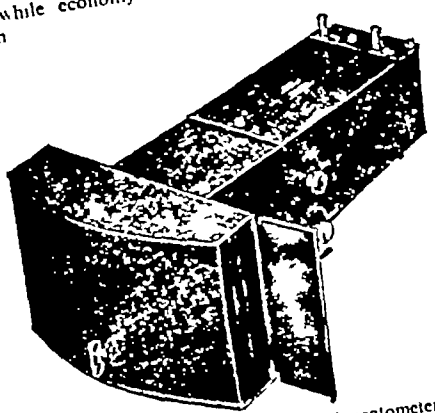

FIG 1—The multiple type sedimentometer

The multiple sedimentometer differs from the original apparatus in that four separate tube images are focused on a single negative (quarter plate) The magnification has been reduced to one, but although the pictures are smaller the actual height of the supernatant plasma column can be read off direct from the photograph by using an ordinary milli metre scale This same scale may be used for measuring off time intervals as 30 mm on the ordinate in each picture represents a period of one hour In addition the sedimenta tion curves or sedigraphs obtained conform to the well established standards set up by Cutler

The method of loading and working the multiple tube sedimentometer differs but slightly from that of the single model Ordinary plate holders are loaded with either films or bromide paper One of these is then inserted through the side door into the moving stage at the back of the apparatus and while the covering slide of the plate holder is being with drawn the stage with the holder is held securely by a locking pin which is automatically released on closing the side door This ensures that the film is always in the same position at the commencement of exposure and is an important point if time markers are to be recorded on the photograph coincident with exposure of the sedimentation tubes (see below) The sedimentometer is then left until the specimens of blood are taken and run into the tubes These are placed in the holder behind the exposure window the lens shutters opened and the clockwork set in motion by pulling out the stop pin above its mechanism

It is not necessary to expose all tubes simultaneously (although this is preferable) other tubes may be added during a reasonable period after beginning exposure of the first tube Furthermore as separate lens shutters are pro vided tube slots that have not been exposed may be used later after resetting the stage After exposure at a time convenient to the operator the lens shutters are closed the motor stopped and the stage returned to its original position by rewinding the clock The covering slide is reinserted into the plate holder which is then ready for unloading Means are provided for identifying each of the sedigraphs by numbers engraved on the holder After development dupli cates are made by photographic printing or by visual copying on to graph paper The prints can be cut up and pasted like large postage stamps on to the case sheets of the patients In using both single and multiple type sedimentometers time intervals represented by vertical white lines on the negative are recorded on the sedigraphs by placing in front of the unexposed film or paper a transparent celluloid sheet marked with thin vertical lines so arranged that each passes the light slot at ten minute intervals (Fig 2)

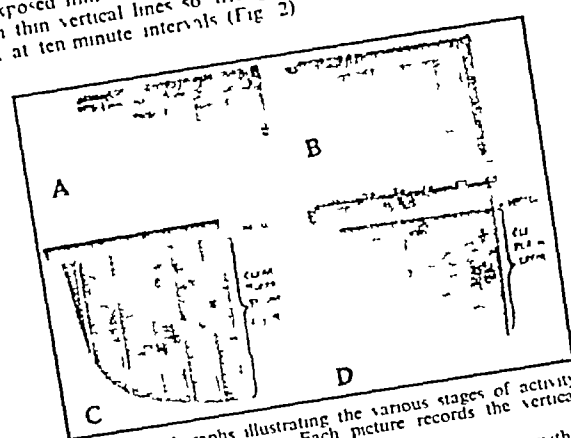

FIG 2—Sedigraphs illustrating the various stages of activity in pulmonary tuberculosis Each picture records the vertical time markings referred to in the text

(A) Sedimentation index = 7 mm (A sedigraph just within the upper normal limits for men)

(B) Sedimentation index = 16 mm (A mild "diagonal curve" sedigraph indicating low grade activity)

(C) Sedimentation index = 28 mm Cutler sedimentation time = 30 minutes (Very active disease)

(D) Sedimentation index = 21 mm Vertical curve indicates markedly active disease

A brief reference to the scope of the multiple sedimento meter would not be out of place It only requires a quarter plate sheet of paper for four recordings and the method of daylight loading is simple It does not need any special lighting for exposure and will fit into any odd corner After the medical officer has obtained the blood specimens an attendant can be trusted to complete the process as any carelessness such as inaccuracy in filling tubes can be detected in the photographs No special time need be set apart for the sedimentation tests nor is it necessary to wait until enough cases have accumulated before recording their sedimentation rates On the contrary the test can be made during routine clinical examinations or at any other con venient time Finally several readings of a sedimentation rate are more valuable than a single one These are provided by the sedigraphs which give a more vivid impression of the variations of the sedimentation phenomena than a series of numerical readings taken at different intervals

Besides the helpful suggestions of many friends my thanks are due to the manufacturers The Ellis Optical Co of Croydon and to Messrs Hawksley and Sons Ltd of 17 New Cavendish Street London W 1 who are prepared to supply the sedimentometer or any further information on the subject

Correspondence

Pharmacology in the Curriculum

SIR,—Professor B N Ghosh in the *Journal* of September 11 (p 552) deals very clearly with the present-day defective system of teaching pharmacology When I was a student pharmacology was taught in the pre clinical period, and by the time we reached the final year it was mostly forgotten Therapeutics were taught by physicians in the wards, who gave scanty attention to the subject, so that we began to regard the treatment of disease as of secondary importance Even the leading textbooks of medicine dealt very meagrely with the subject The result was that a newly qualified physician experienced a good deal of difficulty in practice when patients demanded more than the mere diagnosis of their ailments

The incorporation of pharmacology with therapeutics was a distinct step forward, but it is still far from ideal, simply because the teaching of therapeutics in the pre-clinical period is a sheer waste of time In my opinion applied pharmacology should be taught in the wards by a pharmacologist, who should be in charge of clinical beds Systematic lectures should be fewer in number, and there should be more demonstrations of the actions of drugs on patients in the wards The student should be trained in observation and in the use of his critical and reasoning faculties If real progress in the teaching of pharmacology is to be made, the sooner we discard the older methods of teaching the better, otherwise we will go on producing more and more stereotyped parrots instead of scientific physicians—I am etc

Adult Serum in Measles

SIR,—Sir Kaye Le Fleming (*Journal*, September 25, p 612) is to be congratulated on having taken the opportunity of using "adult" serum in a measles epidemic in a public school If there have been previous similar attempts in other public schools it is to be regretted that details have not been published, as the subject is of very great importance to them No one doubts the efficacy of "convalescent" serum treatment properly applied The [illegible] in the L C C reports of 1933 and 1936 [illegible]ure that all medical officers of [illegible] make use of serum [illegible]requently discussed [illegible]of Schools Associa- [illegible]d a supply of con- [illegible]ing a public school [illegible] the right procedure [illegible]nciple may be beyond [illegible]ling with large masses [illegible]t undesirable [illegible]g convalescent serum [illegible]ual cases The second [illegible]ue of adult serum has [illegible]fficulty lies in deciding Since, I imagine, most [illegible]ider it quite unjustifiable apart from most excep- [illegible]enuation is the essential [illegible]f convalescent serum by the rather general and wholesale method adopted by Sir Kaye Le Fleming would be inadmissible, because it would "prevent" a certain number of cases, which might subsequently be affected, thereby discrediting the treatment and the doctor But the great value of his experience lies in his statement that the use of adult serum does attenuate an attack, to some extent at least, during a school term, whether given in the early incubation stage or before exposure It may be true that the mere statistical results he gives are not very convincing—for example, in the comparative number of complications and length of the period of pyrexia in the various groups—and we all know that measles epidemics in schools vary considerably in virulence, but his conviction of the clinical evidence of attenuation must carry great weight

It is a common experience that the first batch of cases after the original one always includes more than the known and probable close contacts The conclusion to be drawn from this seems to be that we should advise parents that all susceptibles should be given adult serum within a week of the onset of the first case, without, however, making too extravagant claims as to what adult serum given in this way can accomplish No doubt the opportunity will be given to many public school medical officers to corroborate Sir Kaye Le Fleming s observations next term if adult serum can be obtained in sufficient quantity Is not this question of an adequate supply of serum a matter of national importance? The public schools are only a fraction of the population which would benefit by this treatment—I am, etc,

L R LEMPRIERE
Oct 20 Medical Officer Haileybury College.

Adult Whole Blood in Measles

SIR,—In the last measles epidemic I had to face the problem of protecting young and often weakly contacts in an impecunious neighbourhood I used 5 to 8 c cm of whole blood taken from one or other of the parents and injected immediately after it had been withdrawn Of ten children so treated one had a moderate attack, four or five had attacks so slight that the diagnosis at another time might have been in doubt, and either five or four children had no attack at all For convenience, promptness, and cheapness the method is obviously excellent

Its disadvantages include the risk that the parent s memory of having had measles may be at fault, and the possibility of the parent having contracted syphilis after the birth of the particular child The latter possibility can be minimized by tactful questioning I should welcome the views of other readers as to whether the method is justifiable or can be improved on Has anyone else been using it?—I am, etc,

Woodford Green Oct 20 E B GROGONO

Tuberculosis of the Cervical Lymphatic Glands

SIR—In the valuable article by Mr Reid and Dr Wilkinson in the *Journal* of October 16 (p 740) on tuberculosis of the cervical lymphatic glands, there are certain statements in the section dealing with pathology which invite comment and which would appear to require further investigation

The authors state that in the series of 119 cases, in no instance were "secondary" lesions found elsewhere How far is this true in other parts of the country? Our experience in this area would suggest that a combination of cervical gland tuberculosis with pulmonary disease is

for them whether it is the milk in the schools, the services of the doctors the care of the welfare centres, or whatever is applicable to the Joneses case

Economic Factors in Hygiene

It is quite clear to me that as I have more than once pointed out you cannot separate the health problem from the economic problem The doctor cannot do this in his private consulting room and surgery and the Ministry cannot do it in the nation at large For the simple reason that in the last resort it is the individual unit or perhaps even more important the *family* unit that presents the problem in each case Now it is not the business of us doctors to solve the economic problems of the nation but it *is* our job to know about health And if we are not quacks it is the duty of statesmen to listen to what we have to say

The Prime Minister told us at Scarborough a week ago that he could not promise any reforms until we had got further on with our preparations for the defence of the nation The suggestion is that we must see to it that our boot is strong enough to make our kick effective if and when the mad dog attacks us We cannot escape the stern logic of this argument I take Mr Chamberlain's statement to mean that he sees no chance of paying out money for those specific measures which might adjust the lag that exists between economics and national health questions This lag is most marked in the matter of food Until the right foods are made more readily accessible to the people one of the main factors in national fitness will not have been dealt with

Food and Fitness

I use the word food rather than the word nutrition We doctors know a good deal more to day about the principles governing nutrition than we did even a few years ago But the medium through which the principles of nutrition operate is *food* Not food chosen by experts and weighed out by chemists but a good supply of mixed fresh food Make the mixed diet accessible and nutrition will look after itself Food first, and then some plain homely instruction upon what to do with it, and how to cook it and how not to waste it Here is work for energetic and trained women women who can organize and who can teach And there are such women available

I know the Ministry of Health cannot perform a miracle and feed the multitude by an edict from Whitehall But when such a miracle did once happen you will remember that a dozen men picked up the fragments of bread and fish that remained, and no doubt fed still more hungry people with them We throw our herrings back into the sea, or, nearly as wasteful, we dig them into the earth as manure The problem of food distribution does not seem to be solved so well to-day as it was 2 000 years ago But then life has become much more complicated since that time We must not blame the Minister of Health for these things It is only because we are accustomed in this country to face the whole issue and not merely a part of it that I draw attention to them But certain it is that if we are going to face up to the whole position then at some time or other we must close the gap that now exists between the economic and the hygienic parts of our task

Extension of Medical Benefits

But even if we only look at the hygienic part still taking the broad view of this matter of national health—as we doctors do—there is a whole heap of things that must come and if they can only come slowly let us hope it will not be too slowly!

There is to begin with the extension of medical insurance benefits to all dependants of the worker not merely between the ages of 14 and 16 as we are promised Let us hope that that very British phrase, the inevitability of gradualness' may not be applicable to this most desirable step forward If this step were taken the doctor would be put on his honour to keep the worker's children well not merely to get them well when they fall ill We should in this way recruit every panel doctor into the ranks of preventive medicine, and interest him much more than is the case to day in activating the health services for the use of the whole family Health services have been so planned that the term family doctor' has become in many parts of the country, a farce The doctor should be paid to keep the family fit not paid at the rate of so much a year to attend the head of it when he is ill The doctor then becomes a real link between the health services and the family for whom they exist He can plead on their behalf, nay if necessary he can *demand* the services they specially require

The Doctor's Work in the Future

And if it be advanced that the doctor's training has not, up to now, fitted him for work of this sort then the sooner it does so fit him the better Inevitably the doctor's work in the future will be more and more educational and less and less curative More and more will he deal with physiology and psychology less and less with pathology He will spend his time keeping the fit fit rather than trying to make the unfit fit And we must make it worth his while to do this work This reorientation of his education, and of his work, is overdue, and it will remain overdue until reorientation takes place in the attitude of the health authorities towards him and towards his sphere of usefulness And we must not think his education is finished for all time when he becomes qualified It is a duty we owe to every doctor to enable him to get back now and again to the stimulating and informing atmosphere of the wards and the laboratories and no less helpful, to the atmosphere created by his colleagues and teachers

This means spending more money, of course, but I cannot conceive how money could be better spent and, as a long time investment, I believe it would pay over and over again For to repeat, it is at the periphery and not only at the centre, where energy and knowledge are required The doctor is the expert who makes contact with the individual and acts as the conducting medium between the individual and the facilities afforded by the health services through the local authorities And not only the health services There is this important matter of physical training and recreation Grants are good and sergeant majors are useful but the doctor's training is essential to a proper use of physical methods in the production of national fitness And so also in the equally important teaching of the proper selection and the proper preparation, of food

If economics has let us down—and it seems as though it has—medicine must do what it can to hold the fort until economics comes once more to its help

---

The sessions of the fifteenth International Congress of Ophthalmology will be held in the Semiramis Hotel Cairo from December 8 to 14 the subscription fee for members being fifty Swiss francs and for ladies and other associate members twenty five francs Residence will be available in the hotel which will be specially opened for this congress three weeks before the usual time—namely, on December 1 *En pension* or bed and breakfast terms as desired are obtainable A summary of the scientific communications will be distributed before the meetings of the congress Arrangements are being made for visits to historical monuments and museums in Egypt for various excursions, and for special social functions Details of these may be obtained from the general secretary of the congress, Dr M Tewfik P O B 2001, Cairo, Egypt

unaffected by the drug In view of these five relapses it was thought that perhaps the astringent effect of the potassium permanganate was protecting areas of infection from the action of sulphanilamide, and in consequence treatment without irrigations has now been adopted as a routine No relapses have occurred among the cases so treated With regard to the two cases which were unaffected by the drug it seems possible that sulphanilamide may only be effective between a certain range of *p*H values This would appear to be a subject for investigation Blood examinations showed, in a few cases, a slight haemoglobin reduction and a small increase in lymphocytes was also noted, but otherwise no important variation in the white cell count occurred The patients suffered from no obvious ill effects

Treatment was also carried out in twenty-six other cases, with histories of infection ranging from one to five months The dosage varied from 15 grains, three times a day, to the larger amounts described above All these cases have cleared up in a most satisfactory manner, and I have now none of them remaining in my wards, all having been discharged as cured In addition to the administration of sulphanilamide the usual routine treatment for gonorrhoea was carried out in these cases Sulphanilamide appeared to have a most favourable action on cases complicated by arthritis, acute posterior urethritis, and epididymitis So far as can be judged from early results on a small number of cases, it would appear that sulphanilamide has a definite action on the gonococcus and will prove of great value in the treatment of infections due to it—I am, etc,

Brown Bread versus White

Sir,—I have been very much interested in the leading article in the *Journal* of October 16 on the question of brown bread, which sums up very admirably the state of medical opinion with regard to the deficiencies of white bread I spoke on this matter at a maternity and child welfare conference held in Liverpool in 1936, and then made a suggestion that in order to get any practical advantage from modern knowledge it is essential that some person or body of persons in authority should give an informed statement as to how brown bread can be prepared in such a way that the vitamins are not removed This in effect means that there should be a milling prescription which a miller could use in the preparation of a standard brand of flour A person desiring brown bread with its appropriate complement of vitamins could therefore demand bread made from flour milled in accordance with this prescription With such a safeguard he would be enabled to obtain what he needs at the present time but which he is unable to obtain

It is time that the Ministry of Health, the Medical Research Council, or some other authoritative body took up this matter and gave an official pronouncement—I am, etc,

Liverpool, Oct 25

Physiology of the Stomach

Sir—The comparative figures of carcinoma of the stomach in a London and an Amsterdam hospital, given by Sir Arthur Hurst in his Harveian Oration (*Journal* October 23, p 783), interest me very much, because of confirmatory observations made by my wife and myself over a period of ten years It happens for various reasons, that we have visited many families in Holland, and that they have visited us here We have both commented upon the speed with which our Dutch friends swallow their food At many a dinner table we have found ourselves hopelessly behind in the race, and have guessed at the urgent signals (in Dutch) sent out by our hostess for the family to hold back In the same way, when we have been the hosts in London, we have found ourselves finishing in a hurry in order not to delay our guests Now, this observation of ours of eating habits in Dutch families, most of whom are moderately well to-do, complements the figures given about 500 people, presumably having rather small incomes, seen at the Wilhelmina Gasthuis It would seem, then, that both rich and poor in Holland are quick eaters

Some interesting international comparisons on these lines are possible Did not an Australian physician, whose name I cannot remember, recently offer evidence that the decline of Rome had been due to malaria? What about the diet and decline of the Roman Empire—or, indeed, of several other empires?—I am, etc,

Reginald Hodder

London, S E, Oct 23

Magnesium Trisilicate

Sir—Dr N Mutch in his article on magnesium trisilicate (*Journal* October 16, p 735) quotes the *Pharmaceutical Journal* (1936, **136**, 721) as a reference to the paper on this subject which I read at the British Pharmaceutical Conference in 1936 This paper was reported in full in the *Quarterly Journal of Pharmacy and Pharmacology* (1936, **9**, 445), whereas a brief extract only appears in the *Pharmaceutical Journal*

Had Dr Mutch read the official report quoted in the *Quarterly Journal of Pharmacy and Pharmacology* he would probably have modified certain of his statements

In the same sense, the reference made by Dr Mutch to comments by Mr Ragg is misleading in so far as Mr Ragg raised certain points in the verbal discussion which followed my paper, which points were, with others, dealt with satisfactorily at the time (*Quarterly Journal of Pharmacy and Pharmacology* 1936, **9**, 545) I am sure that Mr Ragg would be the first to agree that his remarks hardly justified the special place given to them in Dr Mutch's list of references

As was explained in my paper and amplified at the meeting of the British Pharmaceutical Conference, I am well aware of the limitations of the analytical methods I use, but as applied to the magnesium trisilicate of commerce they are rapid and of sufficient accuracy They enable the analyst to discriminate between good and indifferent material, and they enabled me to make a preparation in every way equal to that championed by Dr Mutch Furthermore, in spite of the analytical work being "carried out with meticulous care," the table now given by Dr Mutch shows the same vagaries and inconsistencies which I myself found and commented upon For example, the full 100 per cent of the material is not accounted for, and the bases found do not quite agree with the antacid values, while the ratios are calculated on the unwarranted assumption that the iron, calcium and aluminium are uncombined with silica and that the magnesium alone is so attached

But none of these points detracts from the practical value of Dr Mutch's confirmation at the British Medical Association meeting this year of the principle laid down at the British Pharmaceutical Conference in 1936, that it is essential that only the true substance, as originally used by Dr Mutch, should be employed I am therefore grateful that he now gives the matter further publicity and at the same time I regret the necessity for these observations,

and still longer in bone, particularly in the vertebrae, where a chronic osteomyelitis may lead to paraplegia A rabbit may develop this lesion in spite of vigorous humoral immunity, such that a small dose of its serum will fully protect another rabbit against a lethal dose of culture Here in a clear-cut form is the experimental parallel to a frequent clinical anomaly In spite of procedures which should raise the concentration of serum antibodies to the highest possible level, infection often persists We cannot complacently assume that humoral immunity is the whole story we are forced, in fact, to conclude that it is not That it is necessary there is no doubt but something else of which we have scarcely an inkling takes part in disposing of the invader, and the study of this infection—and indeed of infection generally—will have taken a great step forward when the nature of this other factor is brought to light

MEDICAL USES OF RADIUM

The latest radium report issued by the Medical Research Council is the fifteenth of a most valuable and useful series, in which are summarized year by year the results obtained at some twenty centres holding radium on loan from the Council Here both clinical and experimental work is controlled by the Radiology Committee which has been largely instrumental in advancing radiotherapy in this country from a more or less crude empiricism to its present position of an established branch of medical practice based upon definite scientific principles This has largely been effected by the cordial and loyal co-operation of the Radium Commission and the British Empire Cancer Campaign both of which have consistently supported the Council's policy of concentrating their supplies of radium at a limited number of institutions in different parts of the country Centralization of this type has been eminently successful, since it not only places adequate means of treatment and research in competent hands but also ensures the provision of suitable laboratory facilities without which further progress would be impossible Careful attention is also given to the standardization of records which is one of the most important factors in assessing the values of different forms of radium treatment

A new feature of the report for 1936 of which an account will be found at page 867 is the inclusion of a section dealing with the use of massive radium units So far as can be seen at present the results have been highly satisfactory but of course time is necessary before a final judgement can be passed upon the permanence of the curative effects so far obtained, the outlook, however, promises well for the future The experimental work has been mainly concerned with the important questions of radiosensitivity, dosage, and the administration of lethal doses of radiation to neoplasms with a minimum damage to healthy tissues It has long been known from clinical experience that the skin possesses great powers of recovery from the effects of radiation and also that damage can be materially reduced by dividing the dose The investigation of the most advantageous intervals between treatment as well as the exact details of suitable individual doses is thus a matter of urgent importance, and to this a large amount of attention is being given Information upon the methods of action of radiation on living tissues, both normal and malignant, is constantly accumulating, and the experimental results continually find their application in practice

The whole series of reports on the medical uses of radium forms such a valuable and interesting record that we venture the suggestion that a comprehensive index to their contents would be of the greatest assistance to those who are engaged in serious research work, either of a literary or an experimental character The preparation of these reports for the Press is not the least among the many notable services which Professor Russ, the secretary of the Radiology Committee has rendered to the cause of British radiotherapy

PSORIASIS

The problem of psoriasis still continues to exercise the dermatologists and recently Lane and Crawford[1] have approached it from the statistical side deriving their material from the patients of the Massachusetts General Hospital while Rosen Rosenfeld and Krasnow[2] have examined the theory recently put forward that this disease is associated with faulty lipoid metabolism The test adopted was the estimation of cholesterol in the blood, the normal figure being given by these authors as 228±26 mg per 100 c cm of serum They found that the value for patients with chronic localized psoriasis and for those with psoriasis affecting the nails only were comparatively low and seldom exceeded the normal quantity they also observed that the more extensive the psoriasis and the more active the scaling the lower the cholesterol content of the serum The greatest tendency to the reduction of cholesterol in the serum was found among persons suffering from lesions of the nails only They concluded that psoriasis is associated rather with hypocholesterolaemia than with hypercholesterolaemia and they suggest that this is because the cholesterol of the serum is removed to the affected areas Other observers have claimed that when cholesterol is administered to psoriatic subjects there is no increase in the cholesterol of the serum whereas in normal individuals an increase can be detected For

[2] Ibid., p 1093

Coramine, 3 7 c cm., was given intravenously, as was one pint of saline, which improved the patient s condition He was taken back to bed with an intratracheal tube passing continuous oxygen, but, in spite of this and a blood transfusion, died seven hours later, his temperature having risen to 107° F The blood pressure half an hour before death was 55/30 mm Hg A post-mortem examination showed osteomyelitis of the frontal bone, early meningitis, and multiple lung abscesses There was no odour of ether detectable in the lungs

The second case, occurring seven days later, was that of a man aged 58 His temperature was 98 4° F and his pulse rate 80 He had a chronic suppurative otitis media, for which a radical mastoidectomy was being performed The anaesthesia was induced and maintained as in the previous case but more ether was used, as the operation took some time Clonic spasms started at the end of the operation, when the skin incision was being sutured and ether was not being used The convulsions were controlled with 4 c cm of evipan and the patient sent back to bed, the head of the bed being raised and an intravenous saline given The temperature rose to 103° F the blood pressure was 130/90 mm Hg This patient rapidly recovered, and next morning was remarkably well

In both cases the ether in the bottle on the Boyle's machine was used for other patients with no ill effects, and the same machine had been used, and the details of the administration of the anaesthetic were the same, as in 257 other patients anaesthetized during the last two months —I am, etc,

Central London Throat Nose and Ear Hospital, Oct 12 H G Earnshaw

Pubertas Praecox

Sir,—Dr Shapiro does not appear to have read my note on a case of pubertas praecox completely I should like to draw his attention to this quotation from it "The cervix uteri is well developed and the uterus on bimanual examination was found to be almost adult size No enlargement of the uterine appendages could be detected" As one would not determine this by vaginal examination the only other way is per rectum I should also refer him to a similar case under the care of Drs Park and Novak at Johns Hopkins Hospital (1932) The child was operated on for a granulosa-cell carcinoma A minute granulosa-cell adenoma was removed from one ovary at operation and confirmed on section The child, however, continued to menstruate quite regularly after this In a condition so little understood it would be wiser to adopt a less dogmatic opinion —I am, etc,

Southampton, Oct 17 W L Kerr, M B, B S

"The Tonic Pupil"

Sir,—James Ware was the first English surgeon to describe hypermetropia He did so in a famous paper, published in the *Philosophical Transactions of the Royal Society of London* in 1813, on "Observations relative to the Near and Distant Sight of Different Persons," in which the following passage occurs

If has also been commonly believed that the size of the pupil is influenced by the distance of the object to which the attention is directed, this aperture being enlarged when the object is far off, and becoming more and more contracted as it is brought near But though the activity of the fibres of the iris is sometimes sufficient to be visibly influenced by this circumstance, yet in the greater number even of those cases where the dilatation and contraction of the pupil are powerfully influenced by a difference in the strength of the light the distance of the object considered alone produces so little effect upon it as to be scarcely perceived That it has however, in general some degree of power on the pupil is highly probable and an extraordinary instance of this kind exists, at the present time in a lady between thirty and forty years of age, the pupil of whose right eye, when she is not engaged in reading or in working with her needle, is always dilated very nearly to the rim of the cornea, but when she looks at a small object nine inches from the eye it contracts within less than a minute to a size as small as the head of a pin Her left pupil is not affected like the right, but in every degree of light and distance it is contracted rather more than is usual in other persons The vision is not precisely alike in the two eyes, the right being in a small degree near sighted and receiving assistance from the first number of a concave glass, whereas the left eye derives no benefit from it. This remarkable dilatation of the pupil of the right eye was first noticed about twenty years ago, and a variety of remedies have been employed at different times with a view to correct it, but none of them have made any alteration It should be mentioned that, in order to produce the contraction of the pupil, the object looked at must be placed exactly nine inches from the eye, and if it is brought nearer it has no more power to produce the contraction than if it were placed at a remoter distance It should also be mentioned that the continuance of the contraction of the pupil depends, in some degree, on the state of the lady s health, since, though its contraction never remains long after the attention is withdrawn from a near object, yet whenever she is debilitated by a temporary ailment the contraction is of much shorter duration than when her health is entire'

It is possible that this nervous and anisometropic lady suffered from a tonic pupil in her left eye —I am, etc,

Glasgow Oct 23 W J B Riddell.

Indications for Induction of Abortion

Sir —Reduced to simple terms two things emerge from Dr Percy Hardy s letter in the *Journal* of October 23 (p 827) First, it is suggested that abortion should be legalized if three, or perhaps four, doctors, preferably general practitioners, with a wide knowledge "of the environment of women of the poorer classes who are ill," agree that pregnancy should be terminated Secondly, these doctors, 'not necessarily consultants'—this suggests that the medical problem is not the prime consideration—are to consider what the effects of pregnancy and child birth would be on the patient in question These are wide and vague terms of reference The decision arrived at would constitute a fiat for an operation for abortion The elastic terms of such a reference would make doctors a law unto themselves, and in fact would place them above the common law of England What would the lawyers have to say about it?—I am, etc,

London, S W 1, Oct 23 Redmond Roche

Sir —I am in complete accord with the pleas put forward for the legal recognition of abortion in cases of genuine rape, but I wonder what your readers opinions would be in relation to the following "eugenic" case

A young lady was engaged to be married On the eve of the wedding it was for the first time disclosed to her and her parents that her fiancé's father had committed suicide while of unsound mind This naturally upset them very much, but the wedding was allowed to proceed on the understanding that there must be no children as the outcome So far, so good—or bad After a short time the husband himself became mentally affected, in what manner I do not know, but at any rate sufficiently to cause him to be admitted to an institution for several months Shortly after his release, and in a spirit apparently of sheer irresponsibility and bravado, he threw precautions to the winds and impregnated his wife This was the story of the girl and her mother when they presented themselves to me in the hope that "something could be done" They were both in a dreadful state of apprehension, and I think with reason I am no mental expert, but I take it that the risk of the offspring (and the girl was undoubtedly pregnant) developing some psychosis

countries Before giving advice to the Spanish Government the mission decided to convene a larger body of experts at Geneva including all those who had introduced methods of typhus vaccination—namely, Professor Weigl Director of the University Biological Institute at Lwow, Hans Zinsser Professor of Bacteriology at the Harvard Medical School and Professor L Anigstein of the State Health Institute Warsaw The meetings which were held on February 8 to 10 were presided over by Professors E Sergent and Ciuca, who had had considerable experience of typhus in Algeria and Rumania respectively and Dr M T Morgan of the Ministry of Health The resolutions adopted were as follows In the case of a threatened epidemic the following measures should be taken (1) organization and operation of a systematic and periodical delousing service among the troops and civilian population (2) organization of a service for the early detection of typhus cases (3) preparation of a plan for isolation and hospital treatment of the patients (4) preparation of a plan for isolation of infected localities (5) formation of stocks of serum of immunized animals and (6) vaccination with a killed vaccine of all the medical sanitary and auxiliary staff When an epidemic occurred the following steps should be taken (1) the measures for delousing and detection should be intensified (2) measures for the isolation of patients and of typhus foci should be applied (3) the serum of convalescents should be collected and used for protection of the staff and other contacts except persons immunized with killed vaccine for more than one month and less than twelve months previously and (4) mass vaccination of the military and civilian population of infected localities should be carried out

AUSTRALIAN CANCER CAMPAIGN

The report has now been issued of the eighth Australia Cancer Conference which was held at Canberra from April 13 to 16 under the chairmanship of Dr J H L Cumpston Director General of Health for the Commonwealth In addition to an account of the proceedings and of the resolutions passed there is included in it a review by Dr C E Eddy of recent developments in radiological physics a review of the activities of the Commonwealth x ray and radium laboratory of the University of Melbourne during 1936 and an account of the developments in that year in connexion with cancer control in Australia It was urged by the Conference that the Commonwealth Government should become a member of the International Union against Cancer that State organizations formed for the control of cancer should become affiliated with the British Empire Cancer Campaign and that more active steps should be taken in regard to educational and publicity work throughout the Commonwealth Most of the clinical papers read at the Conference are being published in the *Medical Journal of Australia* a paper by Dr J S MacMahon on epithelioma of the lip will appear in the *Australian and New Zealand Journal of Surgery* The Conference supported the recommendation of the National Health and Medical Research Council that an annual sum of £30 000 should be made available to establish a permanent and reliable system of medical research A committee will report to the next conference on the better organization of cancer investigation in Australia particularly on developments in biochemical research in relation to cancer problems and of biochemical science in relation to treatment

ERADICATION OF CONTAGIOUS ABORTION IN NORWAY

Norway was one of the first countries to undertake a serious campaign against tuberculosis in cattle As far back as 1895 the tuberculin test was introduced for the detection of infected animals By a programme directed towards the eradication of the disease which includes regulations forbidding the importation of reacting animals and the sale of reacting animals except for slaughter it has proved possible to reduce the extent of tuberculous infection to the extremely low level of 0 18 per cent Undoubtedly the anti tuberculosis campaign has been helped by the small size of the average herd and the absence of overcrowding but even so the achievement is one to be proud of Attention is now being given to the control of contagious abortion This disease though less important than tuberculosis from the standpoint of human hygiene is nevertheless of greater economic importance to the farmer by reason of the loss of calves the frequent sterility of the infected animals and the diminution in quantity of the milk supply that are so often associated with it By a law dated June 29 1934 regulations were introduced with the twofold object of preventing the spread of infection from one herd to another and the elimination of infection from herds already infected The State provides free blood testing and affords compensation for the slaughter of reacting animals Special control is exercised over the movement of infected animals over the sale of pregnant animals, and over common grazing grounds The scheme is partly voluntary but is apparently meeting with widespread acceptance According to the Chief Veterinary Officer Mr N Thorshaug[1] 119 587 samples of blood were examined at the expense of the State in 1935 in addition to 14 000 special samples taken from animals destined for sale Altogether 10 500 animals were found to react positively of which 8 655 were slaughtered with indemnity from the State Records were at hand in 1935 of 2 278 infected herds No fewer than 636 of these had been successfully freed from the disease by October 1936 787 no longer contained any reacting animals but were still waiting for their final agglutination test before being declared free 647 had not more than two reactors while only 208 had more than two reactors There is reason to believe that in a short time contagious abortion will be practically eradicated from the majority of the herds in Norway We in this country may well look with envy on this success The difficulties with which we are faced are very considerable but it is to be hoped that a serious attempt will now be made by the Government to deal with animal disease in a more

[1] *Bull Off int Hyg publ* 1937 29 956

"Mediaeval Conceptions of the Anatomy and Physiology of the Central Nervous System" and "Galen on the Eye" respectively His last contribution, the Cavendish Lecture in 1936, was his demonstration, based on the relation between ossification and age, of the true identity of the bones of the Princes murdered in the Tower *

In 1903 Arthur Keith was appointed Curator at the Royal College of Surgeons of England, and Leonard Hill, who was at that time teaching physiology at the London Hospital, asked Wright to come to the London to take Keith's place Wright readily accepted this invitation, and generations of London Hospital students are, therefore, indebted to his teaching Not only was he a brilliant lecturer with a ready command of the English language, but he could draw on the blackboard with consummate skill Wright, indeed, could make the dry bones live!

Naturally he gained many academic distinctions He became a D Sc of the University of Birmingham He was Harveian Society Lecturer in 1933 In 1912 he was president of the Anatomical Section of the British Medical Association, having been secretary in 1904 and vice president in 1910 Wright was the first treasurer, and then president, of the Anatomical Society, and was a member of the editorial committee of the *Journal of Anatomy* He made many contributions to the society's meetings and to the Journal Typical of these were his "Reports on Teratological Literature" prepared for many successive years for the Journal Wright was joint author with Parsons of a handbook on practical anatomy designed especially for the primary fellowship examination this book survives in a different form in the *Six Teachers Anatomy* and the *Six Teachers Anatomy for Dental Students* In addition to examining for the London University and for the Royal College of Surgeons, he examined at different times for the Universities of Oxford, Glasgow, Liverpool, St Andrews, Leeds, Bristol, and Aberdeen He flew to India with Buckmaster in 1935 as a representative of the Royal College of Surgeons

Soon after his appointment as lecturer in anatomy at the London Hospital, Munro Scott, late Warden of the Medical School, died, and Wright was appointed Dean of the Medical College in 1910, a position he was destined to hold for no less than twenty-seven years Thus, for the first time, the affairs of the Medical School were directed not only by a member of the medical profession and a Fellow of the Royal College of Surgeons, but by a man whose administration and teaching were coloured by a background of culture and classical learning It is, perhaps, difficult for the younger generations to realize how much the Medical School owes to Wright for his guidance in these early years Knutsford and E W Morris were making the London Hospital Wright took charge of the Medical School Wright was largely responsible for the appointment of James Mackenzie to the staff of the hospital in 1911, and taking a great interest in the better education of dental students he was responsible for the foundation of the School of Dentistry at the London Hospital in October, 1911 Always conscious of the needs of the students, and realizing the particular difficulty confronting men working in the East End in those days, he was responsible for the opening of the old students' hostel in 1911 But this was merely a beginning, and in 1934 he had the satisfaction of seeing the opening of the present fine building by H M Queen Mary

To all who knew him—and they were many—Wright was a great figure To a wide circle of men he was a personal friend Among his closer friends he reckoned Arthur Keith, William Bulloch, Leonard Hill, Gordon-Taylor, Marlborough Pryor, George Northcroft, and Buckmaster Wright lived life to the full and enjoyed the society of men He was a member of the Athenaeum, Burlington Fine Arts, and Savage Clubs, and a delightful companion at dinner He was particularly fond of the Savage Club, where his long association resulted in his election as an honorary member His spare time was devoted to books and pictures Botany, geology, and gardening were among his hobbies He was a life member of the Zoological Society and of the Zoological Club His chief hobby was probably archaeology, and he was an active member of the Royal Archaeological Society He spent his holidays visiting castles and churches, and happy were those who were privileged to accompany him on these expeditions His house was made beautiful by a collection of lovely things, particularly paintings by the Japanese artist, Ishibashi, and among his most treasured possessions was the head of a Greek girl picked up on a rockery in the West of England, which had been sculptured during the best period of Athenian art

Wright lived the greater part of his adult life with his close friend and companion, Gwynne-Jones, at Gerrards Cross But Gwynne-Jones died in 1933 Only a few months ago, when he was already suffering from the long and ultimately fatal illness which he bore so patiently, he married Gwladys Gwynne-Jones, widow of his former friend In 1912 he had caused the words "Amara-Lento-Tempera Risu" from Horace to be inscribed over the entrance to the Medical College This phrase Wright liked to translate "Temper bitter things with a quiet smile To this he remained faithful to the last

T A GOODFELLOW, C B E, M D

Lecturer in Medical Ethics, Victoria University of Manchester

Dr Thomas Ashton Goodfellow, one of the best known general practitioners in Lancashire, died at his home on October 24, at the age of 72 Dr Goodfellow was a student at Owen's College, Manchester, and qualified in 1888 with the M R C S, L R C P In 1889 he took the M B of London, proceeding in 1891 to the M D His first period of hospital residence was as a house physician at the Manchester Royal Infirmary Later he acted as house surgeon at the Salford Hospital, after which he was appointed resident medical officer at the Infirmary It was after concluding this appointment that he went into general practice, and gradually built up a reputation as one of the most outstanding men in general practice in the North of England He joined the British Medical Association in 1893, and always took the keenest interest in both local and national medical organizations He was a member of the Manchester committee which had to administer the National Health Insurance Act when it came into force, and he later joined the Panel Committee, becoming in due course its chairman He was also for many years associated with the small consultative committee of medical and allied services which was set up by the Ministry of Health to adjudicate and report on complaints of irregularity in carrying out the terms of service under the Act During the war he acted as chairman of the Manchester Medical War Committee, which was entrusted with arranging for the supply of qualified men to the R.A M C and looking after their practices during their absence on active service He was also medical officer in charge of the auxiliary military hospital at Lawnhurst and Didsbury Lodge

Respiratory Obstruction

The maintenance of a free and adequate respiratory exchange is of the first importance Respiratory obstruction occurs when the patient s respiratory efforts do not run parallel with the gaseous interchange An obstructed airway dams back carbon dioxide in the lungs hampers the entry of oxygen, exhausts the patient through his muscular efforts to get air in, embarrasses the circulation, and may precipitate a vascular accident When examining the patient beforehand the anaesthetist can often foresee whether he may have obstructive or other difficulties Questioning the patient about his normal activities —does he get out of breath after climbing stairs etc ?—is a better guide to his physical fitness than any formula The presence of anaemia or dehydration should also be looked for it is obviously of advantage to know in advance whether fluids are likely to be required during the operation The full blooded, short necked type of individual is prone to become congested and obstructed during induction The condition of the teeth and the patency of the nostrils are worthy of examination Both the pharynx and the larynx of the heavy smoker are very irritable, and it is useful to remember that when morphine and basal hypnotics depress the sensitivity of the respiratory centre they do not decrease the sensitivity of the larynx to the same extent This combination of circumstances does not facilitate induction with irritant anaesthetic agents

It is most important to be certain that the stomach is empty before induction, and it must be borne in mind that fear markedly prolongs its emptying time At a depth of anaesthesia sufficiently light for the occurrence of active vomiting the laryngeal reflex is intact so that the glottis will close The patient, however, can only hold his breath until the alveolar content of carbon dioxide has risen to a level which, as it were breaks through this reflex and if aspiration is to be avoided it is imperative that the head should be lowered and any vomit in the pharynx removed before this breath is taken Gastric and obstetrical emergency cases should have a preliminary wash out if there is any likelihood of the stomach not being empty The manipulations of the obstetrician during an external version may well express gastric contents and at the depth of anaesthesia necessary for this manœuvre the laryngeal reflex will have been abolished Should vomiting occur there must be no delay in tipping the patient head downwards and removing the vomit preferably with suction The anaesthetist must also remember the possibility of reversed peristalsis A patient suffering from intestinal obstruction must be expected to regurgitate copious quantities of intestinal contents at any moment

SPECIAL CONSIDERATIONS

Before embarking on an operation on the nose, mouth or throat the anaesthetist must decide which of the various methods he is going to adopt to safeguard the patient from the aspiration of blood or pus Apparatus must be tested before being used to see that there is no possibility of blowing liquid ether into the patient's lungs During and after operation the anaesthetist must bear in mind the possibility of a foreign body, such as a forgotten swab, obstructing the air passages, a suitable posture must also be maintained during recovery Some oedema of the glottis may be expected as a result of inflammatory processes in the pharynx or neck This will become much worse if any asphyxia accompanies induction Tracheotomy may be advisable before the induction of anaesthesia, and this is the last resort for any complete obstruction situated in or above the glottis It is inadvisable to give any general anaesthetic before opening a quinsy It is to be expected that a patient with carcinoma of the oesophagus will regurgitate a quantity of mucus

Thyroid patients with obstruction should be given little premedication unless the anaesthetist is on the spot, as their obstruction often becomes worse when they go to sleep When the obstruction is very severe intubation under local anaesthesia is a wise precaution Bilateral abductor paralysis of the cords or tracheal collapse will necessitate immediate intubation The presence of emphysema or of secretion in the tracheo bronchial tree interferes with free gaseous interchange, it takes longer to get oxygen and anaesthetic agents into these patients, and, what is equally important it takes longer than usual to get carbon dioxide and the anaesthetic out again

The consequences of opening the pleural cavity require the anaesthetist s attention if both cavities are opened artificial respiration with positive pressure is essential The changing of the position of a patient too lightly anaesthetized or the presenting of too concentrated an anaesthetic vapour may also upset the respiratory rhythm The angle of his head in relation to his neck and the position in which he lies during operation may interfere with normal respiratory exchange Other points which may not be appreciated are that the use of either the kidney rest or the gall bladder bridge is conducive to pulmonary collapse, and that the prone position and the weight of the abdominal contents on the diaphragm in the full Trendelenburg position hamper respiration

CONGESTED ASPHYXIAL OBSTRUCTION

This may occur during induction A rubber naso pharyngeal tube is useful if attempts to push the jaw forward fail The tube must not be too large and it must be passed before the congestion becomes marked otherwise bleeding will follow and make matters far worse The insertion of the usual pharyngeal airway when the spasm is fully developed is well nigh impossible As his alveolar content of carbon dioxide rises the patient s efforts to get air in are usually successful Oxygen is what he needs and an attempt must be made to force this in for unless the asphyxia is relieved the muscular spasm will not relax until shortly before death When this relaxation occurs there is nearly always time—*though it must not be counted upon*—to insert an airway quickly and inflate the lungs with oxygen

ATONIC OBSTRUCTION

For this type of respiratory obstruction, which develops when the muscles of the jaw tongue and pharynx have lost their tone, a pharyngeal airway is indicated Waters pattern is superior to any other, and if the base of the

he began practice in that city thirty years ago, and was appointed to the honorary surgical staff of the hospital During the war he served in France with the temporary rank of major R A M C, and after his return to Wakefield he published a number of papers on surgical subjects in the *Lancet* and the *British Journal of Surgery* When ill-health led to his retirement from active work the governors of the Clayton Hospital elected him honorary consulting surgeon in recognition of the important part he took in the planning, building, and equipment of extensions, and of his services as chairman of the medical board Mr Thomson has also been for many years medical officer to the White Rose County Hospital in Park Lodge Lane The Mayor of Wakefield attended the funeral on October 12, taking with him the silver casket and scroll, symbols of the City's Freedom, which Mr Thomson was prevented by ill-health from receiving in person when it was conferred upon him some months ago

We have to announce the death, at the age of 63, of Dr Annie Florence Theobalds consulting physician to the Devonshire Royal Hospital, Buxton She studied medicine at Edinburgh, graduating M B, Ch B in 1905, and proceeded M D in 1911 Before going to Buxton she held successively two appointments in Yorkshire—pathologist and assistant medical officer to the West Riding Asylum, Wakefield, and resident assistant medical officer at the Halifax Poor Law Institution She had also been clinical assistant at the Birmingham City Asylum Dr Florence Theobalds settled in practice in Buxton in 1909, and for many years was the only woman practitioner in the town She was appointed to the staff of the Buxton District Hospital as honorary anaesthetist in 1912, and until the time of her death was closely associated with it and was a valued member of the executive and the house committee In 1917 she was elected to the staff of the Devonshire Royal Hospital for Rheumatic Diseases, retiring recently under the age limit She was intensely conscientious in the performance of her professional work, and will long be remembered by the patients who came under her care for her deep sympathy and kindliness She was a member of the committee of the local district nursing association and for many years its chairman, and was also a member of the committee of the Cavendish High School for Girls She was very reserved in disposition and shunned social life, while devoting herself to her patients and her public work without stint Her sudden death will be deeply regretted by those who enjoyed the privilege of her friendship and the advantage of her professional skill She had been a member of the Buxton Division of the British Medical Association since 1909

The death of Dr Walter Sansom has removed from Barrow one of its oldest and best-known practitioners, who was a native of the borough and spent almost the whole of his working life there He was born on October 29, 1868, and studied medicine at the University of Edinburgh, graduating M B, C M in 1890 and proceeding M.D in 1898 After a short period of practice at Hadfield he returned to Barrow, and was honorary surgeon to the North Lonsdale Hospital from 1909 until his retirement in 1936, when he was appointed consulting surgeon Dr Sansom joined the British Medical Association in 1898, and was present at the first meeting in connexion with the formation of the Furness Division in 1903 He served on the executive committee in 1908–10, and was chairman of the Division in 1912 During the war he held a commission as captain in the R.A M C 'W R B writes Having been associated with the late Dr Sansom as his partner in general practice for nearly a quarter of a century I am glad to have the opportunity of adding a few remarks concerning my old friend I have had an unbroken friendship with him all these years He possessed a charming personality an unfailing kindness of disposition, and he has given long and faithful service in the best interests of his profession It can be truly said of him that those who knew him best loved him most, and he has left behind him in the hearts of most of us a very sweet memory of a true friend He was laid to rest in Barrow recently, attended by a large number of those who had been associated with him during his professional life and who were anxious to pay their last tribute to one who was regarded with deep affection by all My very deepest sympathy goes out to his son and his family in their sad bereavement

By the death of Dr Douglas McKissock Ross aged 85 years, on October 9, Brighton has lost a veteran of the medical profession He had been a member of the British Medical Association for fifty-six years, a period not equalled by any other member of the Brighton Division Dr Ross received his medical education at Edinburgh University and was dresser to Lord Lister, then professor of clinical surgery at the University He took his M.D at Edinburgh and the diploma of M R C S Eng, and started practice in Brighton in 1874 He held the offices of police surgeon, physician to the Queen's Road Dispensary, and medical officer to the Poor Law institution He was also visitor to the private licensed houses for lunatics in Brighton His connexion with the latter lasted till his retirement from practice, when he was presented with many gifts from those associated with the institution, including a silver loving cup, a touching souvenir from the inmates, and an illuminated address from the guardians, expressing their appreciation of his long service —forty-two years in duration—and wishing him happiness in his retirement Dr Ross celebrated his golden wedding last year, when a group of Freemasons and doctors some of whom had attended his wedding, waited on him to offer their congratulations to Mrs Ross and the doctor He was a Freemason of many years' standing, and was Master of the Royal Clarence Lodge Six years ago he was presented with a silver salver to commemorate his fifty years of membership Dr Ross lost two sons in the war He was a man of quiet and unassuming personality, loved and respected by all those with whom he came in contact His funeral took place on October 12 at Christ Church, Brighton, followed by his burial in Hove Cemetery It was attended by many of his friends and fellow practitioners, who wished to pay a tribute to a loyal and faithful colleague who had dwelt among them for over fifty years in friendship and agreement

We regret to announce the sudden death on October 11 at Blairgowrie of Dr William Hunter Howat who formerly practised at Dalmellington, Ayr He studied medicine at the Universities of Glasgow and Edinburgh, and graduated M B, Ch B of the former in 1915 During the war he served with a temporary commission as Captain R A M C, and he was for some time physician superintendent of the Lightburn Fever Hospital, Lanark Dr Howat joined the British Medical Association immediately after graduation, and acted as representative at the Annual Meetings of 1925 and 1935, and was chairman of the Ayrshire Division in 1935–6

A familiar figure in the Crumpsall district of Manchester has passed away in the person of Dr Thomas Henry Wignall. Having graduated at Manchester in 1898, he secured an apprenticeship in general practice as an assistant, and then settled in the Blackley-Crumpsall district, where he pursued his life-work He carried out in a characteristically thoughtful way the rigorous duties of his profession For some years he acted as radiologist to the Crumpsall and Booth Hall Infirmaries, gaining in this capacity a profound knowledge of the local population, and when, in 1918, he took up industrial work he brought to it a wealth of experience of the conditions of life among the workers Later in the same year he joined the medical service of the British Dyestuffs Corporation Ltd, and remained there until his death As the

—for example, a sick child with acute appendicitis They begin with twitchings in the muscles of the face, and may soon spread and become generalized The breathing has usually been depressed or somewhat obstructed, and it is thought that the raised alveolar content of carbon dioxide is the factor which determines the onset of the convulsions in most cases In support of this hypothesis it may be mentioned that convulsions have begun upon the addition of carbon dioxide to facilitate blind intubation stopping when the gas was turned off and not returning although ether was used throughout the operation Whatever the stage of the operation the anaesthetic must be discontinued until the convulsions are controlled The respiratory exchange must be increased by rhythmical squeezing of a bag filled with oxygen, though this may be difficult to carry out on account of the respiratory obstruction If no improvement follows lowering the alveolar content of carbon dioxide sufficient evipan or pentothal should be injected intravenously to control the convulsions, the artificial respiration being meanwhile continued

Convulsions—and circulatory collapse—are the most serious manifestations of poisoning by cocaine or allied drugs Other symptoms and signs of toxicity have as a rule been missed or unheeded These convulsions will be stopped by the intravenous injection of a barbiturate, but, as these patients all die of oxygen want, it is the anaesthetist's duty to start artificial respiration without delay and to maintain an efficient respiratory exchange while the barbiturate solution is being prepared and injected

Other Risks

Damage to the Eyes—Precautions must be taken to avoid any anaesthetic agent getting into the eyes The face piece or gamgee tissue and the anaesthetist's fingers must not rub them The eyes should be kept closed throughout the operation If they tend to open they must be repeatedly moistened by the moving up and down of the upper lids If the reflexes have not returned by the end of the operation and the eyes tend to remain partly open a drop of castor oil should be instilled into each eye and the patient should be so arranged in bed that he cannot rub his eyes on the pillow during recovery

Explosions—Sources of explosion are the cautery, naked flames and fires diathermy machines and electric motors faulty electrical connexions and static electricity In the concentrations used during anaesthesia the only agents which are non explosive are basal hypnotics local anaesthetics nitrous-oxide oxygen carbon dioxide and chloroform The quarter from which any draught in the theatre is coming and the relative weights of the anaesthetic and air will determine in which direction the vapour will travel Appreciation of these points may in certain circumstances permit the use of the diathermy needle in the presence of explosive mixtures Static electricity is fortunately an uncommon factor in this country a possible explanation for this being the high relative humidity of the atmosphere A wise precaution is to damp the inside of the bag rubber tubing and face piece with water before induction thereby reducing friction and the risk of electric sparks Soon after the anaesthetic is begun complete saturation of the atmosphere takes place in a closed system with carbon dioxide absorption making the risk of explosion from this cause for practical purposes negligible In the absence of leakage from such a closed system in which the anaesthetic mixture is explosive the diathermy needle may be used with safety except in the vicinity of the lungs or air passages

MEDICAL USES OF RADIUM

REPORT BY MEDICAL RESEARCH COUNCIL

The report of the Medical Research Council on the medical uses of radium during the year 1936[1] illustrates very strikingly the increased use of radiotherapeutic measures in the treatment of malignant disease When the annual figures contributed by the various centres during the years 1930–6 are added together a total of 18,496 cases of malignant disease is reached of which 5,452 (29 5 per cent) were treated by surgery alone, and 7,355 (39 8 per cent) by radium alone

The numbers of cases treated by different methods during the year 1936 are shown in the accompanying table

TABLE I—*Relative Frequency of Surgical and Radiotherapeutic Treatments in 1936*

	Number Treated in 1936	Percentage
By all methods	4 419	100 0
surgery alone	1 365	30.6
„ radium alone*	1 426	32.3
x rays alone	858	19.5
„ surgery + radium	224	5 1
„ „ + *x* rays	285	6.5
radium + *x* rays	215	4 8
surgery + radium + x rays	46	1 0

* Treatment by radium alone may involve surgery of access.

Cancer of the Breast

The Birmingham General Hospital presents a very full account of the work done in this condition during the past year There has been a slight diminution in the number of cases treated by radium which is attributable to the more extended use of high voltage x-ray therapy in operable and border line cases and subsequent amputation, whenever this is practicable When treatment by radium has been carried out the exact position of the needles with respect to each other to the tumour and to the skin has received careful attention and in addition to clinical measurements made at the time of insertion valuable assistance has been afforded by combined radioscopy radiography and stereoscopy The value of the last named method is greatly increased with practice but it is pointed out that these methods still leave a good deal to be desired and some improved technique would be of great value though it would have to be simple in application and at the same time suitable to the large numbers of needles used for treating carcinoma of the breast

In treating axillary lymph glands it is found that especially in stout patients many receive an inadequate dose owing to the difficulty of securing even distribution of dosage Attempts have therefore been made to use barrages from three or more planes of needles without placing any in the axilla itself Stainless steel wire has entirely replaced silkworm gut for securing the needles and the filtration has been increased to 0 9 mm platinum by the use of additional sheaths At Birmingham as elsewhere surgery is advocated in all early cases and the radiotherapist treats only such as are unsuitable for surgery owing to some accompanying general condition such as advanced age diabetes pulmonary or cardiac disease of long standing and refusal of the patient to submit to operation At the Marie Curie Hospital cases at the time unsuitable for operation have been treated during the past year by the low intensity method of x ray therapy

St Bartholomew's Hospital reports on the results of a routine histological examination of the breast and axillary

ROYAL COLLEGE OF SURGEONS OF EDINBURGH

At a meeting of the Royal College of Surgeons of Edinburgh held on October 19, with Mr Henry Wade President, in the chair, the following successful candidates were admitted Fellows P C Barkla J Benson B D Best M D Black, W A Browne S R Chandra P N Chaudhuri J V Clark A Conway W C J Cooper D H Craig Lydia M Duff, I M D N Farquharson G N Findlay, B P Funder H W Gordon H M Grant H J Green P W Ingram E S Lawrie H Macmillan I P J MacNaughton H C Maling H V Morgan S K Sen C L E L Sheppard E W Thomas N J Townsley R Walkingshaw E W Watts A J Webster, R Whittaker T I Wilson, J G Youngman

At the annual meeting of the Royal College of Surgeons of Edinburgh held on October 20 the following officers were elected for the ensuing year *President* Mr W J Stuart *Vice president* Mr Henry Wade *Secretary and Treasurer* Mr J W Struthers *Representative on the General Medical Council* Mr Alex Miles *Convener of Museum Committee* Mr A Logan Turner *Librarian* Mr H M Traquair *Conservator of Museum* Mr C F W Illingworth

ROYAL COLLEGE OF PHYSICIANS OF LONDON

The Bradshaw Lecture on The Genetics of Transposition of the Viscera will be delivered by Dr E A Cockayne at the College, Pall Mall East S W on Thursday November 4 at 5 p m and the Fitzpatrick Lectures on Conquest of Disease in the Tropics by Dr Harold Scott on Tuesday and Thursday November 9 and 11, at 5 p m

Medical Notes in Parliament

The second session of the present Parliament was prorogued on October 22 after the Lord Chancellor had read a King's Speech which reviewed the work done The Speech hoped that the fullest possible use would be made of the Physical Training and Recreation Act It went on "The national health services have been further developed and improved The rate of progress in the clearance and replacement of slums has been satisfactorily maintained, the abatement of overcrowding is proceeding and house building has continued at a high rate The Speech also referred to the Factories Act, whereby greatly improved provision had been made for securing the safety and health of factory workers and to the measure for the development and improvement of maternity services in Scotland

The King opened the new session in the House of Lords on October 26 In the course of the King's Speech it was stated

My Ministers are anxious that energetic steps shall be taken to complete the measures for the protection of the civilian population against air raids A Bill to put the necessary arrangements on a statutory basis will be brought forward for your consideration

My Government have announced their intention to assist the production and to increase the consumption of milk, and to facilitate the improvement of milk distribution A Bill to this end and further proposals for the welfare of agriculture will be submitted to you

A comprehensive publicity campaign is being undertaken to ensure the fullest use of the public health services and to encourage their expansion The policy of improving housing conditions will be energetically pursued

"My Government will further develop their social policy by introducing legislation to enable meals to be supplied to boys and girls attending junior instruction centres to provide medical care for young persons who have left school and entered employment to reduce the age limit for the award of pensions to blind persons to enable further information to be obtained for the study of the population problem to amend the financial provision for slum clearance and the abatement of overcrowding and to make further provision for the improvement of agricultural housing.

A measure will be laid before you to amend the penal law and to enable improved arrangements to be made for dealing with offenders, including juveniles and those who commit repeated offences

Legislation on the subject of rural housing in Scotland and on other matters of Scottish interest will be submitted to you

During the subsequent debate on the same day in the House of Commons Sir John Simon said that legislation would be introduced in due course for the assistance and development of the milk industry The guiding principle would be that an increase in the consumption of liquid milk would result in advantage both to the national health and to the producers This could best be secured by creating greater confidence in the safety and cleanliness of the milk supply Measures designed to raise the standard of our dairy herds were also proposed

League of Nations Nutrition Report

Asked by Mr Keeling on October 21, what action he proposed to give effect to the recommendation of the League of Nations Mixed Committee on Nutrition that every Government should conduct a vigorous policy of education on nutrition for the instruction of the general public Sir KINGSLEY WOOD said Earl Stanhope and he recognized the importance of education on this subject This would be dealt with in the course of the national health campaign now in progress

Investigation into Incapacitating Sickness

Sir Kingsley Wood is considering the general question of a comprehensive investigation into the extent and incidence of various forms of incapacitating sickness among insured persons, but is not yet in a position to say in what form the results of any such investigation would be made generally available

Vaccination Deaths—Mr T GROVES asked, on October 21 whether taking the averages for the last thirty years although less than half the babies born in this country were vaccinated the deaths caused by vaccination to children under 5 were more than twice as many as those caused by small pox Sir KINGSLEY WOOD in reply said Mr Groves's conclusions seemed to have been arrived at by including among the deaths caused by vaccination all cases in which vaccination was mentioned on the death certificate although in many of these the death was assigned by the Registrar-General to some other cause Sir Kingsley further told Mr Groves that he did not propose to take steps for the discontinuance of vaccination

Inoculation against Influenza in the Army—Mr GROVES asked on October 21 whether the arrangements made in December, 1936, to inoculate against influenza 500 men from five corps were carried out if so, whether any of them and how many subsequently developed influenza and what was the interval in each case between the inoculation and development of influenza? Mr HORE BELISHA replied that 678 men who volunteered were inoculated against influenza of these eighteen developed illnesses diagnosed as influenza" ten during the first two during the second and six more than two weeks after inoculation The inoculations were carried out at the time when the influenza epidemic was at its height Before any beneficial effects of inoculation could have had

the mouth and the alveolus gave the worst, as the growth spreads rapidly into the cellular tissues of the floor of the mouth and also invades the bone In addition to this epitheliomata in these situations are less radiosensitive than in the more favourable sites If the bony tissues are invaded it is impossible to destroy the neoplastic cells without producing necrosis of the bone itself, it is therefore necessary after preliminary irradiation of the growth in the soft tissues to await the subsidence of all reaction and then to treat any affected bone by surgical excision

Intrinsic carcinoma of the larynx treated by the thyroid fenestration method has given good results and usually the normal speaking voice has been regained With extrinsic laryngeal growths and those beginning in the hypopharynx the case is very different and surgical treatment although admittedly involving serious and extensive mutilation, still offers more chance of success than radiotherapy Carcinoma of the oesophagus still remains an almost insuperable' problem Diagnosis is almost invariably late and radiation treatment only palliative

Teleradium Therapy

Teleradium therapy—or the external application of the radiation from a large quantity of radium—is still in its experimental stage The 1 gramme unit at the Middlesex Hospital has been in constant use since 1932 and is soon to be replaced by a 4 gramme unit It has mainly been employed in the treatment of neoplasms in the mouth, pharynx and larynx, not because its use is regarded as unsuitable in other sites but because it was required for the whole time in the treatment of these particular conditions Since the installation of the 1 gramme unit it has been the first method of treatment adopted for the conditions mentioned and in some cases no further treatment has been necessary It was however often found that additional treatment was essential This of course varied according to the condition of the patient implantation of radium needles in residual growths of the tonsil and tongue surface application of radium needles mounted on dental applicators in carcinoma of the floor of the mouth, and block dissections of the glands of the neck were all used as circumstances dictated

A detailed account of teleradium application may be of interest

Two sessions of two hours each in twenty four hours are given with at least a six hour interval between In certain cases—*for example orbital tumours*—two areas are sufficient to cover the involved region In the mouth pharynx and larynx up to ten areas are used in order to cover adequately the whole field of suspected involvement both primary and secondary with a margin of healthy tissue These areas are drawn on the patient with an aniline pencil guided by a circular ruler of the same diameter as the aperture of the unit and a corresponding chart is kept When both sides of the face or neck are being irradiated alternate sides are treated in rotation in order to obtain uniform saturation The margins of adjacent areas are allowed to touch and no ill effect from overlapping has been observed If only two areas are used a total of twenty four hours treatment on each area can be given but with multiple areas a total of twenty hours is the maximum the healthy tissues can stand Treatment is given daily and is continuous for ten to thirty days without an interval depending on the number of areas. When only two areas are used treatment is given only once daily in order to prolong the total duration

Experience has proved that the slightest inaccuracy in application may make all the difference between success and failure and it is necessary for each treatment to be supervised by a specially trained medical officer In most cases the treatment is followed by a skin reaction which normally proceeds from an erythema to a desquamative epithelitis which heals rapidly but sometimes the skin reaction is severe and in these cases ambrine dressings have been found useful It has often been noticed that when the skin shows only a slight erythema a mucosal lesion is covered by a fibrinous membrane

Special attention must be paid to nursing, and in mouth and throat cases the mouth should be irrigated with bicarbonate solution after each meal Abundant fluids are necessary and the patient is made to drink at least five pints daily During the four years in which the 1 gramme unit has been in use in only two cases has a tracheotomy been necessary in consequence of the severity of the reaction in the mucosa

Non malignant Conditions

At the Marie Curie Hospital 1,265 patients suffering from simple metrorrhagia have been treated by radium Of these 869 were menopausal cases all over 40 years of age the remaining 396 were aged 40 years or under It was observed that a number of patients admitted as simple cases of non malignant haemorrhage were found on histological examination of biopsy material to have early cancer of the cervix or corpus Myomata usually of small size, were found in 138 of the haemorrhage cases

An investigation of non malignant haemorrhagic uterine cases is being carried out from a histological point of view It is hoped that it may be possible to determine whether any correlation exists between histological type with its possible aetiological significance and the response to radium treatment.

The clinical section of the Medical Research Council's report is preceded by a brief summary of the more purely experimental work in physics and radiology Dr Mayneord at the Royal Cancer Hospital has completed his researches on the standardization of gamma ray dosage which confirm the previous estimate that the ionization produced in one hour by a point source of radium element at one centimetre distance and filtered with 0 5 mm of platinum is equivalent to 8 3 *r* Problems connected with the control of cell division by radiation are discussed by Dr Spear and Dr Glücksmann of the Strangeways Laboratory Cambridge and Dr Lea deals with the action of radiations on bacteria Dr Mottram at the Mount Vernon Hospital records experimental work on radiosensitivity as do also Dr Colwell and Dr Gladstone at the Middlesex Hospital At the latter hospital Professor Russ and Miss Scott report upon some biological effects of continuous gamma irradiation, while Professor Paneth Dr Tillman and Dr Moon at the Imperial College of Science and Technology have been engaged in the investigation of neutrons and some of the physico-chemical effects produced by neutron bombardment

BRISTOL ROYAL INFIRMARY

200th ANNIVERSARY FESTIVAL

The two hundredth anniversary of Bristol Royal Infirmary was celebrated on October 21 and 22 by three outstanding events—a reception by the Lord Mayor at the city Art Gallery attended by 900 people a reception of a more domestic kind at the hospital itself for past and present staff and students and a dinner at the University Union with over 300 guests The Church in the person of the Bishop and Dean the City in the person of the Lord Mayor and Sheriff the University in the person of the Vice Chancellor and the members of the medical faculty the local medical profession and representatives of nursing all assembled in honour of this ancient charity Delegates also attended from the Royal Infirmaries of Birmingham Cardiff Leeds and Liverpool the Sheffield United Hospital, and Guy's and St Thomas's One of the delegates from Guy's was its matron Miss MacManus formerly matron at Bristol

The guests were received by Lieut Colonel P G Robinson, President of the Royal Infirmary, and Alderman

Letters, Notes, and Answers

QUERIES AND ANSWERS

Treatment of B Coli Pyelitis

'Abu writes Could any colleague suggest a line of treatment for the following case? A girl, aged 6, suffers periodically from attacks of abdominal pain and vomiting, followed by haematuria and albuminuria The last attack *six months ago* responded rapidly to the usual urinary sedatives and antiseptics The present attack is not responding to treatment, and the urine now contains not only blood and albumin but also *B coli* I take it the condition is one of *B coli* pyelitis

Nocturnal Twitching of Lower Limbs

'Wilts has a patient aged 39, who is much troubled with spasmodic movements and twitchings of the lower limbs in the late evening particularly in bed She describes the condition as the fidgets' Physical examination is entirely negative, and, apart from this distressing condition, the patient is perfectly well Suggestions as to aetiology and treatment would be appreciated

Income Tax

Change in Partnership

Y explains that X and Y were in partnership on a half-share basis up to March 31 1937 when Z took over X.'s share The assessment for 1936-7 was based on the earnings of the practice for 1935, and tax thereon was paid in January and July, 1937 What is the position of X and Z. with regard to the July instalment?

*** The tax is in respect of the income of the practice for the year ended April 5, 1937, and—ignoring the five days March 31 to April 5—Z has no share in the income of that year and is not concerned in the July instalment in any way That payment should be shared between X and Y, as if the change in partnership had not taken place

Proportion of Rent etc as Expense

G P lives in a neighbourhood which has greatly deteriorated residentially The whole of the ground floor is used for purposes of the practice but the local inspector of taxes will allow only two-fifths of the rent etc as against one half which G P claims Should he appeal against that decision?

*** G.P would be well advised to write to the inspector—or call and see *him*—and say that unless he can reconsider his decision a formal appeal will be made Notice should be given when the formal notice of assessment is received G P can appeal either to the Special Commissioners in which case the hearing will be in London, or to the General Commissioners in which case the hearing would be somewhere in the neighbourhood In either case the proceedings are entirely confidential "G P would be asked to explain why he claims one half instead of two fifths of the rent etc and the Commissioners would give their decision immediately

LETTERS, NOTES, ETC

Cysts in Upper Incisor Region

Mr H T Roper-Hall, M B B D S (43A, Calthorpe Road, Five Ways, Birmingham, 15) writes In connexion with a paper which I am preparing upon the cysts which occur in the upper incisor region, I shall be grateful if readers will be kind enough to let me have details of any of their cases, preferably of non-dental origin, such as those of the incisive canal etc Radiographs and models or diagrams of this area will be very welcome

An American Medical Publisher

Dr Walter R Bett sends from New York the following appreciation of Paul B Hoeber who died on August 20 One of the best known medical publishers in the English speaking world Hoeber was a puzzling blend of sophistication and simplicity of aggressiveness and generosity, of cynicism and ideals Though he lacked the accepted attributes of the successful business man, he possessed a shrewd insight into human character and excelled in diplomacy when occasion demanded Small alert impatient excitable, enlivening his conversation with telling bits of *German slang and jumping from one topic to another*, the invariable cigar between his lips even when telephoning—so he impressed himself upon the casual visitor Those who knew him more intimately penetrated below his impulsive and fidgety make up and learnt to respect his sympathy disinterestedness and courage At the age of 18 Hoeber started a medical bookstore on East 59th Street New York City, throwing himself wholeheartedly into this venture Not content with supplying the books which were asked for he made a point of knowing the subjects in which his customers were interested so that he could show them any new publication in their line of work As business flourished he moved to Fifth Avenue in 1926 Meanwhile he had begun to publish books under the name of his firm Paul B Hoeber, Inc Among the journals which he issued the *Annals of Medical History* deserves to be singled out for special mention While admittedly filling an intellectual need, commercially this was a risky undertaking at any time, especially in the days of the war Hoeber not only launched this magazine but for twenty years took a legitimate pride in its reputation as the aristocrat of medical journals' *sparing no expense in the service of its type and illustrations Until quite recently* advertisements had been rigidly excluded *from its numbers* Himself keenly interested in medical history he published many valuable monographs in that field such as the *Clio Medica* series The walls of his Fifth Avenue office were covered with signed photographs of medical historians throughout the world—a remarkable and fascinating collection But he had set *himself too high* a standard in excellence not caring sufficiently whether he made any material profit if only his intellectual children were proudly attired To escape inevitable results in 1935 he wisely decided to join forces with Harper and Brothers of New York. His publications *continued to retain the name of his firm* 'Paul B Hoeber, Inc Medical Book Department of Harper and Brothers"—a concession which gave him great pleasure

Rural Hygiene in the Far East

In our notice of the report of the Inter governmental Conference of Far-Eastern Countries on Rural Hygiene published on October 23 at page *815*, the name of the publishers of the report (Messrs. George Allen and Unwin Ltd 40 Museum Street W C 1) and the price (2s 6d) were *omitted*

Medical Golf

A meeting of the London Irish Medical Golfing Society was held at Princes, Sandwich on October 16 and 17, with the following results O Malley Cup J Ambrose, 2 up Lett Cup P A Smyth E Goggin Canny Ryall Cup P Nyhan (18) 66 E. Goggin (11) 68 B Doyle (14) 70 President's Prize (scratch) R H Jones (4) 155 Captain's Prize R H Jones (4) 5 up Cahill Trophy R H Jones (4) 146 Mannix Cup J Herbert 314 M J Smyth 315 Junior Prize F L M Laughlin Veteran's Prize J Grace Best scratch score on October 17 J A Flaherty, 71 + 1 = 72

DISORDERS OF THE LIVER

CONGRESS AT VICHY

The International Congress on Hepatic Insufficiency held at Vichy from September 16 to 18 proved an unprecedented success The inaugural meeting in the theatre of the Grand Casino was presided over by M. MARC RUCART Minister of Public Health The president of the Congress Professor M LOEPER presented his opening address, and Dr L BINET president of the Society of Medical Sciences of Vichy officially welcomed the delegates from different countries After the various international delegates had replied M Marc Rucart declared the Congress open

Functional Tests

Professor K GLAESSNER in a paper on the functional tests for liver insufficiency, concluded that they were not yet precise enough for a diagnosis to be made on them alone In the major forms of hepatic insufficiency functional tests were *superfluous* and *clinical facts* usually sufficed In latent *mild* and *incipient forms they did* prove of value not only in diagnosis but also in prognosis and treatment Professor M R CASTEX and Dr L GARCIA dealt with the subject of pigmentary hepatic insufficiency and described two forms—one dependent on canalicular involvement and the other on functional hepatic insufficiency Professor L BINET pointed out that sulphur in the hepatic tissues had long been recognized and that a sulphur compound taurocholic acid, existed in the bile Dr E URBACH dealt with the relation between skin and liver diseases and Professor C I. PARHON with the complex subject of the liver and endocrine glands Dr N HAMILTON FAIRLEY in a paper on hepatic insufficiency in malaria said that jaundice might be haemolytic in type due to blood destruction or toxic in origin due to hepatitis but the latter did not result in cirrhosis Pigment stones sometimes resulted

In the Medical Section MM R DEBRE G SEMELAIGNE and E GILBRIN discussing idiopathic polycholia in children due to excessive storage of glycogen and fat stressed its congenital origin and early onset and regarded hepatomegaly and retarded growth as its two most important manifestations Dr M J OLMER reviewed the hepatic and extrahepatic factors concerned in oedema in diseases of the liver and Drs A L CRANDALL C IVY W N ELTON A BASSLER and H I GOLDSTEIN considered the relations of the liver and of nutrition to special aspects of the nervous system MM N PENDE and M BUFANO held that all conditions of hepatic vagotonia insured a good storage of hepatic glycogen and mobilization of fat whereas in hepatic sympathicotonia hepatic storage of glycogen was decreased the combustion of fats increased disassimilation of cholesterol resulted, and there was acetonaemia and lactacidaemia

In the Section of Therapeutics Professor B O PRIBRAM said that pre operative and post operative hepatic insufficiency was generally due to hepatitis In mild cases only hepatic oedema was present but in the more severe inflammatory exudate ensued Ether was the only general anaesthetic permissible while in cholaemia spinal and local anaesthesia were advocated In cholaemic haemorrhage vitamins C and D were sometimes effective Dr F GALLART MONÈS considered dietary and MM M PIERY and M MILHAUD the role of hydro-mineral therapy in relation to hepatic insufficiency In their opinion Gilbert's old view solidly supported by Geraudel that hepatic insufficiency might result from either hypo hepatism or hyper hepatism had been unduly neglected and should be revived Mineral waters activating the hepatic functions generally contained sodium bicarbonate as a principal component, whereas those capable of moderating the hepatic function included calcium and magnesium sulphate

THE TUBERCULOSIS ASSOCIATION

VISIT TO PARIS

On the initiative of Dr R H Hazemann recently principal medical officer to the French Ministry of Health and Dr F R G Heaf Secretary to the Tuberculosis Association the association this year paid a visit to Paris staying there from *October 14 to 16 In the absence of Dr Roodhouse Gloyne* Dr L. S T Burrell acted as president supported by Sir StClair Thomson A reception by the Comité National de Défense contre la Tuberculose was held at the Cité Universitaire—a hostel accommodating 3 000 students of all nationalities The reception was followed by a banquet at one of the restaurants of the International Exhibition given by the Ministry of Health and the Reception Committee of the Exhibition The Minister of Health in his speech of welcome stressed the pioneer work of this country in public health administration that of Sir Robert Philip in tuberculosis control and of the Brompton School in thoracic surgery On the two following days the members were received by the Mayor in the Hôtel de Ville and visits were paid to the Hôpital Laënnec and Dispensaire Léon Bourgeoise the Pasteur Institute and BCG laboratories the well organized medical and social services of the Caisse Interdépartementale d Assurances Sociales the Ecole de Puériculture the neighbouring city of Suresnes with its unique open air school and other social buildings and the sanatorium of Francon ville an institution of 540 beds equipped with a first class surgical unit under the direction of Dr Monod The visitors were also given opportunities of seeing the International Exhibition under most favourable conditions The warm welcome and generous hospitality accorded to the members of the Tuberculosis Association will leave a lasting impression among those who were present at what proved to be an instructive and enjoyable meeting the success of which was in no small part due to Dr Godard in whose hands the arrangements of the visit were placed

OBSTETRICIANS AND GYNAECOLOGISTS

COLLEGE DINNER IN LONDON

The seventh dinner of the British College of Obstetricians and Gynaecologists was held at Claridge s on October 22 with the President Sir EWEN MACLEAN in the chair

After the loyal toasts had been honoured the health of "The College was proposed by the Chancellor of the Exchequer Sir JOHN SIMON The influence of the College he said was of much value in raising the standard of obstetrical treatment and would surely take a large part in reducing the maternal mortality figures Its diplomas were recognized throughout the world as representing the highest standard of efficiency The Midwives Act of 1936 was a great achievement in public health legislation Nearly all the local authorities had now completed schemes under this new Act for the establishment of a service of midwives and the concentrated co ordinated effort to which the College and the voluntary nursing associations were contributing should bear fruit in the next few years Sir John Simon expressed his pleasure at knowing that the *College had also turned its attention to the improvement of maternity care in India and held out the hope that* it might receive a Royal Charter

The Year s Work

Sir EWEN MACLEAN prefaced his remarks with messages *of good will from colleagues over seas and also from* Lord Dawson P R C P Lond regretting his unavoidable absence In the past year the College had added a hundred new members and twenty five new Fellows and within the next year the total would reach 600 including ninety women Of the total 250 lived over seas—75 in Australia 60 in India, 40 in Canada and 15 in New

when there is a rupture of the gut the pain increases in intensity, and becomes generalized all over the abdomen, peritoneal symptoms developing shortly afterwards Diagnosis between a simple contusion and a rupture of the intestine is impossible at first, but the patient must be kept under constant observation, and if pain persists and does not vary in its intensity operation should be performed

343 Reflex Anuria

According to P Deuticke (*Zbl Chir* August 21, 1937, p 1975) it is recognized that reflex anuria may occur in various diseases or injuries of the urinary tract, female genital organs, or other abdominal organs, or as a skin-organ reflex after sudden immersion in cold water Its production in the contralateral kidney from kidney lesions has been doubted owing to the rarity of such a condition, the lack of experimental support, and the difficulty of excluding the possibility of there being small concretions or parenchymatous lesions in the secondarily anuric organ Deuticke records a case in proof of the existence of uretero renal crossed reflex anuria His patient had right pyonephrosis and ureteral obstruction due to carcinomatous metastases, followed by cessation of function of the left kidney This began to secrete again after a right nephrostomy ceased when the tube had been displaced, and returned to action after a second operation had been done for drainage of the right ureter Some therapeutic significance attaches to this case if it is compared with the one reported by Gotting, in which the anatomical conditions, again following cancer of the cervix were similar, and a decapsulation done on the reflexly anuric (unobstructed) kidney was ineffective, death following from persistent anuria

Therapeutics

344 Eupaverine in Embolism

P Valdoni (*Policlinico* Sez Prat, August 16, 1937, p 1557) states that eupaverine was introduced by Denk in 1933 for the treatment of embolism in the limbs and the pulmonary artery Out of his twenty five cases of embolism in the limbs, seventeen were cured, three were improved and five were failures The site of the embolus in the seventeen successful cases was the axillary artery in one, the brachial artery in four, the aorta in one, the femoral artery in one, and the popliteal artery in ten In seven out of nine cases of pulmonary embolism complete success was obtained The drug was given intravenously in doses of 30 mg for peripheral embolism and 60 mg for pulmonary embolism According to Denk, the effect of the injection is almost immediate in pulmonary embolism, and in peripheral embolism it appears in about half an hour and lasts for about three hours, after which it is necessary to repeat the dose Valdoni records six cases of pulmonary embolism, of which four died, and two cases of peripheral embolism, of which one died He concludes that eupaverine should only be used when immediate embolectomy is impossible

345 Pellagra

S Petri *et al* (*Hospitalstidende* July 13, 1937, p 817) give an account of work undertaken in two Danish hospitals, which dealt with six cases of pellagra All these women patients suffered from depressive psychoses, and had developed secondary pellagra in spite of an apparently adequate dietary They were treated with ventriculin, which is a dried, defatted, pulverized preparation of pig's stomach It was given by the mouth in water, with the addition of hydrochloric acid in certain cases in which achylia was demonstrable Though it had no uniformly beneficial effect on the course of the psychoses, its administration was invariably followed within two months by the disappearance of all the signs of pellagra Discussing the aetiology and pathology of pellagra and allied diseases in the light of these experiences the authors conclude that pernicious anaemia, pellagra, and polyneuritis have so many characteristic features in common that it is justifiable to regard as a common denominator disease of the stomach It gives rise, in their opinion, to a gastrogenic neuro cutaneous symptom-complex Clinical experience suggests that, in this group of diseases, preparations of pig's pylorus are less potent than are stomach preparations

346 Short-wave Diathermy

D Kobak (*Arch phys Ther* July, 1937, p 396) discusses the physical characteristics, the biological effects, and the clinical applications of short-wave diathermy He believes that short-wave diathermy—with wave-lengths of from 30 to 6 metres—differs from long-wave or ordinary diathermy in the distribution of the heat and in the biological effects produced He deprecates the term "short wave diathermy,' and suggests instead "radiathermy" because of its inclusiveness and simplicity Short waves are capable of overcoming the resistance offered to other currents by tissues of great density, and are therefore of value in the treatment of inflammatory lesions in bones, joints, and deep-seated viscera In spite of the therapeutic superiority of short-wave diathermy over conventional diathermy, its field is limited to the management of inflammatory, suppurative, and degenerative processes, and to the alleviation of chronic pain Even in this restricted field it is neither a panacea nor a specific, but merely a valuable adjunct to classic therapy

Diseases of Children

347 Empyema in Children

R S Aguirre (*Rev méd lat-amer* May, 1937, p 863) maintains that the causes and mode of production of empyema in children differ according to the age of the patient In the newborn and during the first few months of life empyema is often of septicaemic origin or secondary to suppurative foci such as tonsillitis otitis, impetigo or boils In older children, on the other hand, it is generally secondary to pneumonia or bronchopneumonia The prognosis varies with the age of the child, being gravest in the infant Of 159 cases treated in the children's hospital at Buenos Aires, 108 were over 2 years of age and 51 were below that age In children over 2 the recovery rate was 86 per cent and the mortality 14 per cent, while in infants the death rate was 65 per cent and the recovery rate 35 per cent

348 Exophthalmic Goitre in Children

I Bram (*Arch Pediat* July, 1937, p 419) records a series of 128 cases of exophthalmic goitre in children below the age of 12 Although most commonly observed in adult life Graves's disease may occur at almost any age The sex factor is important only eight cases in this series occurred in males The exciting cause in children was often a focal or general infection, and in 50 per cent of the cases the teeth or tonsils were found to be infected Enlargement of the thyroid and exophthalmos were present in every case, and tachycardia was well marked In many cases the circulatory disturbances caused much concern, and nervousness and tremor were also exaggerated Vomiting and diarrhoea were present in many cases The basal metabolism was difficult to estimate accurately and generally of little value Treatment should be conservative when possible All infectious foci should be removed and the child given an ample low protein diet Prolonged rest in bed is essential, but the child must be kept contented and occupied The author thinks that Lugol's solution may be harmful in many cases, and he states that an occasional case of simple goitre became exophthalmic in type when too much iodine was given The drugs found most valuable were the quinine salts, eserine salicylate, and the barbiturates

Dr J B Burt said that as long as doctors casually sent their patients to a masseuse regardless of prescription practitioners of physical medicine must lose caste He did not mind being a small fish in a large pool, but he did object to being a worm! Dr A R Neligan remarked that with the increasing demand for practitioners of physical medicine the specialist in this field must be developed by postgraduate study Dr E B Clayton also suggested that the teaching of physical medicine would have to be much more a postgraduate subject Dr C L Estrange Orme thought that the prescription of physical medicine was an art, and it was important to have a choice of suitable measures To assess the treatment of sciatica by ionization without regard to massage or manipulation was rather like asking the cardiologist to assess the treatment of rheumatic heart disease by salicylates alone

EPIDEMIOLOGY OF ENCEPHALITIS LETHARGICA

At a meeting of the Section of Epidemiology and State Medicine of the Royal Society of Medicine, on October 22, Sir Arthur MacNalty Chief Medical Officer of the Ministry of Health, delivered his presidential address, taking as his subject the epidemiology of encephalitis lethargica

He said that when encephalitis lethargica appeared in this country in 1918 it was a ' blast from the stars, as Willis might have termed it It was to all intents and purposes, a new disease, the pathology, clinical features, and epidemiology of which had to be worked out from the beginning Later the description given by von Economo of the disease as it had prevailed in the previous year in Vienna became known Medical observers afterwards discovered other examples from the past Some considered that the first account of an epidemic of encephalitis lethargica was Sydenham s account of an epidemic, which he called *febris comatosa* in London in 1673–5, the symptoms resembling those of encephalitis lethargica with hiccup among them Why did encephalitis lethargica reappear in an epidemic form in 1918 and rapidly become so prevalent that in a short time outbreaks were reported from all quarters of the globe? One reason was the increased subjection of the central nervous system to attacks of epidemic disease Modern methods of transport facilitated the spread of infection and increased urbanization of the population and the movements of troops to different parts of the world helped to account for the increased frequency of epidemic nervous diseases The possibility of such diseases occurring in epidemic cycles as influenza did, had also to be considered Again, in considering the seed it was well not to forget the soil The nervous system to-day was subjected to more frequent and urgent stimuli than formerly, and fatigued or overworked tissues might thereby be rendered more susceptible to the attacks of invading organisms Another consideration was the possibility of the evolution of new organisms affecting the central nervous system owing to the assumption of inimical characteristics by originally harmless parasites, organisms usually causing catarrh of the naso pharynx or gastro intestinal tract tending to affect the brain and spinal cord None of the speculations advanced as to the advent of encephalitis lethargica was capable of scientific proof and much had still to be learned about the laws under which outbreaks of epidemic disease were initiated

The Virus of Encephalitis Lethargica

There seemed little doubt Sir Arthur MacNalty continued that encephalitis lethargica was due to a filterable virus He recalled the experiments by McIntosh and Turnbull (1920) in this connexion As with cerebrospinal fever and acute poliomyelitis it seemed a fair assumption that the virus first affected the upper respiratory passages, here it might either lurk and give rise to the carrier phase in the person affected or pass on to attack the brain There was no definite catarrhal stage associated with the early manifestations, but sore throat was a frequent concomitant In view of the frequency of initial conjunctivitis, the virus might possibly reach the brain by the orbital route, infection by the gastro-intestinal route was also a possibility

The evidence for regarding encephalitis lethargica as an epidemic disease was next considered The chief factors relating to the spread of encephalitis lethargica by personal contagion were summarized as follows (1) The restricted topographical distribution of cases, a tendency for examples to clump in certain areas of towns had been noted in Sheffield, Bristol, and elsewhere (2) Examples of multiple cases in families and localized outbreaks in small communities He mentioned an institutional outbreak in a home for girls at Derby in 1919 when twelve out of twenty two inmates were attacked (3) Examples of case-to-case infection in which infection from a common source was apparently excluded had been reported (4) The association of mild and ambulant cases with declared cases had been shown and through the medium of the former the conveyance of infection from one person to another appeared more than probable The epidemiological concept of encephalitis lethargica was therefore similar to that of various epidemic diseases of the central nervous system thus while associated groups of cases or definite epidemics sometimes came to light, the ordinary train of evidence was that only here and there did the widespread infecting agent find an individual who reacted with an unmistakable illness manifested by a characteristic syndrome Alternatively, the agent might infect the individual with such a massive dose or in such a special manner that the characteristic disease was produced In other words, for every definite and characteristic case of encephalitis lethargica there was a large and indeterminate number of people who received and carried the infection without themselves suffering noticeably, or indeed at all

Other Forms of Epidemic Encephalitis

Other forms of epidemic encephalitis existed During the past fifteen years Sir Arthur MacNalty said he had seen a number of sporadic cases of polio encephalitis in addition to the examples occurring in epidemics of poliomyelitis along with the spinal form of the disease There could be little doubt as was evident in the Broadstairs and other recent outbreaks that the virus of poliomyelitis in some instances displayed a tendency to attack the brain rather than the spinal cord This cerebral type of poliomyelitis had to be distinguished from encephalitis lethargica In Japan several outbreaks of encephalitis had occurred during the past hundred years the most recent epidemic, in 1935, causing about 5 000 deaths The disease was due to a filterable virus transmissible to monkeys and rabbits, and was distinguishable both clinically and pathologically from encephalitis lethargica He related other instances from Australia and America to indicate that the epidemiologist must not accept every outbreak of epidemic encephalitis as one of encephalitis lethargica Equally this term should not be given as the description of every case of encephalomyelitis of unknown origin

One of the characteristic features of epidemics of encephalitis lethargica was the different types of nervous manifestations which they presented From a clinical point of view three types were broadly distinguished (1) general disturbance of the functions of the central nervous system but without localization (2) various localizations in the central nervous system, (3) mild or so-called abortive cases The characteristics of one clinical type were often shared by another and it was sometimes difficult to say which characteristic predominated The various types in an epidemic showed signs of a common identity not only by their general symptomatology, but by the gradual merging of the cases

and disappears after surgical treatment It is not a result of the effusion of blood, being well shown when that is minimal, and Klaften concludes that it is due chiefly to oedema and hyperaemia of the belly-wall It does not occur in uterine pregnancy The second "colpodiaphanoscopic" sign, the 'lateral lighting phenomenon," appears to be less constantly present and is due to serosanguineous effusions It consists in a lighting up of the lateral abdominal wall, which is less intense than in the first sign It points to the side of the effusion, but sometimes ectopic pregnancy may give a contralateral effusion Klaften's evaluation of these signs is based on the investigation by transillumination of 358 suspected or known cases of tubal gestation

356 Trial Labour

J Rhenter *et al* (*Gynéc et Obstet* July, 1937 p 5), in a ten-year series of 12,700 confinements, of which 94 per cent followed ante-natal supervision, encountered 270 (2·12 per cent) cases of pelvic contraction Of these, about 8 per cent went into labour spontaneously ten days or more before term, about 37 per cent were subjected to induction of labour, and the remainder—over one half—were given the benefit of a trial labour In only seven out of 141 of these cases was Caesarean section necessary The effect of rupture of the membranes on the descent of the presenting part was carefully observed, as recommended by Commandeur Some 60 per cent of the trial labours ended in the spontaneous birth of a living child, without serious maternal morbidity, and in about 30 per cent artificial modes of vaginal delivery were necessary The 141 cases included six of prolapse of the cord and fourteen in which the foetus either died or showed signs of distress necessitating accelerated delivery The total foetal mortality was 14 per cent and there were three maternal deaths—from shock pregnancy toxaemia and septicaemia following late Caesarean section respectively In the same period the experience at Lyons included 100 cases of induction of labour with a foetal mortality of 13 per cent and only one maternal death The choice between a trial of labour on the one hand and premature induction on the other was generally determined by reserving the former method for (1) cases of apparently serious disproportion in which Caesarean section was thought likely to be necessary, (2) cases of slight disproportion and (3) intermediate cases in which the obstetric history suggested a better prognosis than that based on pelvimetric examination The general conclusion drawn is that premature induction in moderate degrees of pelvic contraction, still has an important place in treatment, and trial labour should not be advised in preference to induction as a routine

Pathology

357 Pneumococcal Infections

M Finland J W Brown and J M Ruegsegger (*Arch Pathol* June, 1937, p 801) have analysed the findings in 764 necropsies on cases of pneumococcal infections correlating the type of pneumococcus identified with the age and sex of the patient, the site and type of infection, the duration of the illness any complications, significant associated diseases and the bacteriological data Of 339 cases of lobar pneumonia, 243 were in males, 104 were due to the Type I pneumococcus eighty-one to Type III and forty-three to Type II seven types accounting for 91 per cent of the cases The age incidence of Type II and III infections was mainly above 50 years The right side alone was affected in 154 cases and both sides in 109 Of 290 cases of atypical pneumonia or bronchopneumonia, 185 were in males the incidence at the extremes of life was greater than was the case with lobar pneumonia, and both sides were affected in 185 cases Although the Type III pneumococcus was found in forty-seven cases, there was a wider distribution of the types of pneumococci than in lobar pneumonia, ten types being responsible for only 71 per cent of the cases Of fifty-five cases of mixed pneumonia thirty-five were males, and pneumococci of Types I and III were the most common individual types The complications most often found were fibrinous pleurisy, tracheobronchitis, empyema, bronchitis, lung abscess, and cardiac dilatation Of the associated conditions, chronic diseases of the lung were associated more often with bronchopneumonia than with lobar pneumonia, and usually with Type III pneumococci In chronic non pulmonary diseases, bronchopneumonia and lobar pneumonia occurred with about equal frequency In acute diseases in which the pneumonia was secondary, bronchopneumonia was present considerably more often than was lobar pneumonia In eighty non-pneumonic cases, pneumococci were found in sixty-two instances in exudates or heart blood, the Type III pneumococcus being most frequent and meningitis the most common lesion In the remaining eighteen cases the pneumococci isolated from the sputum or from the throat or lungs did not appear to be related to the pathological changes

358 Anthracosis

G Mottura (*Arch ital Anat Istol patol* December 1936, p 549) describes an investigation of the pathogenesis and development of anthracosis of the lymph glands, based on the study of more than 450 pulmonary and mediastinal glands He states that the first stage in the process of storage consists in a transient accumulation of the anthracotic particles in the interior of the reticulo endothelial cells of the lymph sinuses, particularly those of the peripheral sinuses Macroscopic anthracosis is due to a secondary and permanent deposit of pigment in the fixed 'anthracophore' cells outside the sinuses The position of these varies, but in the adult they are most commonly found in both the medulla and the capsule of the gland, less often in the medulla only, and least often only in the capsule These fixed anthracophore cells are probably the reticulo endothelial cells which originally took up the pigment granules, and their displacement is only apparent and is due to hyperplastic or atrophic changes in the lymph glands themselves Hyperplasia follows stimulation and subsequent proliferation of the lympho-reticular tissue surrounding the sinuses it affects principally those marginal reticulo endothelial cells which are free from pigment inclusions, so that the pigment-containing cells become gradually more and more deeply submerged under the layer of proliferating tissue and thus appear to move further and further away from the lymph stream Atrophy, on the other hand, leads to the disappearance of the young reticulocytes and lymphocytes, with consequent condensation of the fixed cells in the stroma Hence, if these fixed cells were originally anthracotic an area of pigmentation appears the intensity of which increases *pari passu* with the tissue condensation and the fibrous contraction which accompany the atrophic process Atrophy may affect either the medulla, especially in the neighbourhood of the hilum or the cortex of the gland Cortical atrophy often brings about a displacement of the peripheral sinuses towards the centre, so that the stroma of the sinuses forms a part of the capsular stroma, which becomes correspondingly thicker and incorporates any pigment-containing cells there may be, giving rise to the appearance of capsular anthracosis Fatty infiltration often supervenes, both in the atrophied areas of the medulla near the hilum and in the thickened capsule if the affected areas were already anthracotic, the cortex or the medulla or both will begin to show anthracotic fat' The various combinations of capsular and medullary anthracosis which may be observed in the adult are probably due to the combined effects of the lympho reticular hyperplastic and atrophic processes, which commonly take place during the life cycle of a lymph gland

referred to the distinguished career of Lord Athlone and particularly to the work he had done in South Africa during his long tenure of the office of Governor General, and also as chairman of the council of the Middlesex Hospital and as Chancellor of the University of London Sir Ernest Graham Little, M P, Mr J E H. Roberts, the president of the Medical Society of London, Mr H L. Eason, Principal of the University of London, and the presidents of the West London Medico Chirurgical Society and of the Hunterian Society were among the other distinguished guests present In replying to this toast on behalf of the guests Sir Ernest Graham-Little pointed out that more and more students of the medical schools of London were entering for the University of London s examinations The University was soon to have completed "a visible habitation,' and it was to have the honour of conferring an honorary degree on Her Majesty the Queen

The London Medical Exhibition

Although the Royal Horticultural Society s new hall at Westminster is one of the most spacious (and incidentally one of the most pleasing) exhibition interiors in London it was taxed to capacity for the London Medical Exhibition which was held there during the third week in October Many firms with a multitude of products had to learn the technique of compression The exhibitors numbered 120, and between them staged a comprehensive display of medicinal preparations, foods, and instruments It was a testimony to the thoroughness skill, and ingenuity in laboratory, workshop, and showroom which are enlisted in the service of the medical profession One felt increasing admiration for the way in which medical material and accessories are made to appear attractive with pleasant colours flavours, and scents The general impression was of elegant pharmacy and highly polished and efficient instrumentation Most of the stands were occupied with chemical and pharmaceutical products The visitor was faced on entrance by five large stands of leading drug houses Burroughs Wellcome and Co gave evidence of their continual research, among their recently introduced products being sulphonamide P for use in streptococcal and other infections and their protamine insulin (with zinc) suspension Parke, Davis and Co had a comprehensive exhibit, prominent in which were highly potent concentrates of vitamins in convenient capsule form British Drug Houses made a feature of anahaemin, sex hormone, and vitamin products and a pleasantly flavoured preparation of calcium mandelate Allen and Hanburys, among several new preparations called attention to ascorbic acid (vitamin C) in bottles of twenty five tablets and Boots Pure Drug Co had a range of preparations for the treatment of anaemias and a similar range of antiseptics At other stands, among the preparations which were stated to have been brought out since the exhibition was held in the same hall a year ago were vitamin B, in pure form for injection purposes by the Crookes Laboratories and from the same house, a new non poisonous non irritant antiseptic, introducing the principle of broadened specificity and giving clear dilutions and a liver extract, shown by Glaxo Laboratories representing one of the highest concentrations ever achieved in large scale manufacture The British Oxygen Company had on view eleven models of portable gas-analgesia machines with an inexpensive type of flow-meter and humidifier shown for the first time The use of carbon dioxide in general practice and dental treatment was demonstrated by Sparklets Limited A newly designed electrocardiograph was shown by the Victor X Ray Corporation Radiological apparatus was not greatly in evidence, but the Medical Supply Association had a portable machine with an output of 15 milliamperes at 90 kilovolts

Among many neat devices was a "pocket laboratory" for complete blood and urine analysis the contents being sufficient for 2,500 tests at a cost of one farthing a test. A display of cosmetic artificial features—so-called "aesthetic prosthesis —designed for sufferers from facial and other disfigurements, called attention to itself Another stand proclaimed that it had the most comprehensive and varied range of contraceptives yet exhibited First aid dressings with a non fravable edge were commended There was a photographic outfit for automatically recording the blood sedimentation rate Another exhibitor demonstrated a moulding process for making replicas of skin diseases and wounds in order to facilitate study of the progress of healing and scar formation Indeed the list of interesting devices could be indefinitely extended The stands of Bath Buxton and Harrogate, and those of half a dozen publishers came as pleasant variants to the manufacturing side of the exhibition

The Caldecott Community for Children

A meeting in aid of the Caldecott Community for children from abnormal homes was held at the Mansion House London, on October 19, under the presidency of the Lord Mayor, with the Archbishop of Canterbury and the Earl of Lytton as the principal speakers The Caldecott Community is a new social experiment It exists for the benefit of normal children from abnormal or broken homes, and its purpose is to ensure that such children shall not be permanently affected by the unhappy or unsuitable conditions of their home life but shall have the same chance as more fortunate children of growing up into good citizens Under the term 'broken home' are included homes in which severe friction exists between the parents where the parents are separated or divorced where one parent is dead and the other incapable of looking after the child where there is chronic illness of a parent or a state of drunkenness or crime, where the child is illegitimate and therefore devalued or where there is an unkind step-parent In a large Georgian house named the Mote in the middle of a park at Maidstone Kent, the eighty-two children of this community, of ages ranging from 1 year to 16, are sheltered The average payment made on behalf of each child by the parents or from other sources is £36 a year but the cost per child, including everything—medical attention education, and so forth—cannot be kept below £68 hence a public appeal for endowment for an institution such as society must ultimately recognize to be an essential part of its structure

The Archbishop of Canterbury referred to the pathetic situation of children from homes—unhappily increasing in number—where one or other parent had been divorced or from homes which for other reasons moral or physical were unstable He said that the children and staff in the Caldecott Community worked together as members of one family and every effort was made to discover develop and perfect the personality of the child Lord Lytton quoted the remark of a six year old girl a member of the community who had never known a real home We like it here we feel very safe Miss L M Rendel one of the honorary directors of the community said that the children were of a very intelligent type and with the serene background of the home an endeavour was made to ensure for them an atmosphere rich in culture with discipline hard work good conditions of living and good food The children in the community are divided into five interdependent groups There is first the nursery child under 6 years of age then—one of the most difficult and restless groups—the child just above nursery age then the pre grammar school child from the mental age of 7 to 11 or 13 and then the senior There is also a small group of children of varying ages—intelligent children presenting special difficulties some of them sent by child guidance clinics It is held to be very important to detect the earliest signs of instability and coming that the individual is readjusted to life But the after the purpose of this movement is preventive—to nip relapsed bud what might lead to juvenile delinquency or the remaining disorder in later life ere apparently

THE ABSOLUTE COMFORT and security which the Deimel Underwear affords in the most trying climate is remarked upon by all its wearers Those whose powers of resistance have been weakened by wearing unsuitable underwear derive new strength from Deimel Mesh Garments which absorb and eliminate perspiration quickly, and provide a dry climate about the body which enables the wearer to undergo extremes of heat and cold with comfort

Electrically Heated
BLANKETS & PADS

Blankets from 3 gns *Pads from* 31/6 3 *Temperature Blankets for medical use* £8 10s Single-heat Blanket specially strengthened from £4 4s. Various sizes and prices on application

Insist on Thermega It is vital that these appliances should be made by experienced manufacturers

not uncommon Again, it is surmised that cervical gland infection may successfully protect the individual throughout life against tuberculosis This of course, is the old teaching How far is it indeed now true? Looking through some of the admissions to the Osler Pavilion in the past ten years we are not satisfied that it is by any means always so

It would be instructive to hear the views of others engaged in tuberculosis work, or, better still, to have other series of cases in detail —I am, etc.,

Oxford Oct 18 WILLIAM STOBIE.

Local Treatment of Coryza

SIR,—I have been struck by the remarkable therapeutic effects of the instillation of lipiodol into the lung when carried out as a diagnostic procedure in cases of bronchiectasis or chronic bronchitis A number of patients on whom I had performed a diagnostic lipiodol bronchography have come back after a time asking for another instillation of the oil from which they had obtained much relief The therapeutic results might be explained by the oil forming a thin layer on the bronchial mucosa This cuts off the supply of oxygen to the micro organisms responsible for the inflammatory changes, causing them to be asphyxiated and thus giving the mucous membrane a chance to recover These considerations led me to adopt a treatment based on similar principles in dealing with coryza

The virus responsible for coryza seems to require plenty of oxygen, and for this reason it thrives in the upper respiratory passages Nature's cure for coryza is swelling of the nasal mucous membrane with consequent blocking of the passages resulting in asphyxiation of the virus On this hypothesis it is wrong to try to decongest the swollen mucous membrane by the use of preparations such as ephedrine etc An imitation of Nature's cure would be the coating of the mucous membrane with a thin layer of oil which would cut off the supply of oxygen to the virus At the same time it might be advantageous to incorporate some mild non irritant antiseptic in the oil The coating with oil is best achieved by means of an atomizer Provided the treatment is begun early enough and repeated at frequent intervals coryza does not develop This at least has been my own personal experience In cases in which the coryza is already far advanced the flow of the secretion washes away the layer of oil and the treatment is ineffective —I am etc

London W 1 Oct 20 A ORLEY

Aetiology of Erythema Nodosum

SIR —In view of recent correspondence in the *Journal* may I offer a few remarks on the aetiology of erythema nodosum? On the one hand erythema nodosum is related to tuberculous lesions of the skin including Bazin's disease or erythema induratum and the papulo necrotic tuberculids of Darier Erythema nodosum of tuberculous nature presents small multiple lesions of subacute course Sometimes they pass directly into an indurated state Secondly erythema nodosum may be allergic and especially associated with streptococcal lesions In such cases the nodes are not numerous but are large and shiny They readily disappear and never suppurate or indurate

The old notion that erythema nodosum may be the rash of an acute specific fever (nodal fever) was revived by Dr Lendon of Adelaide in 1905 and again in 1923 by Professor Maxwell Telling of Leeds The alleged association between erythema nodosum and rheumatism can be traced to a paper by Mackenzie in the Clinical Society Transactions of 1886 This paper has been incessantly quoted since it was written but it is merely a review of material collected by the author from other sources and it contains information such as 'father rheumatic and heart sounds murmurish —I am etc,

Sunderland Oct 18 G F WALKER, M D, M.R C.P

Idiosyncrasy to Prontosil

SIR —The explanation offered by Dr Hugh Woods (*Journal*, October 23 p 828) that the febrile reaction provoked in certain patients by the oral administration of prontosil is due to the destruction of large numbers of bacteria, was the one that occurred to me when I first observed these reactions particularly as in one case mentioned to me by Dr D Erskine, the fever was accompanied by a scarlatiniform erythema But three patients —one of whom was not referred to in my previous letter—have told me that when at my suggestion, they took *the prontosil again one tablet sufficed to cause a* recurrence of the fever with its accompanying symptoms If this is true it is I think, more likely that the question is one of idiosyncrasy to the drug and, as my colleague Dr Forman has pointed out, similar febrile reactions may occur in certain persons following the administration of luminal or medinal Moreover, if prontosil causes such reactions in cases of chronic focal infection owing to the direct action of the drug on the bacteria with the consequent liberation of toxins one would surely expect far more severe reactions with possible fatal results in patients with acute infections, such as erysipelas or septicaemia —I am, etc,

London W 1 Oct 22 H W BARBER.

Sulphanilamide in Gonococcal Infections

SIR —An investigation was recently begun at this hospital on the treatment of gonorrhoea in the male with sulphanilamide and the results, so far as can be judged at this early date are most satisfactory All cases considered in this communication were treated as in patients and were not discharged from hospital till they could be regarded as cured Considerable difficulty was experienced in finding an effective dosage for early acute cases and it was only when large doses were used that good results were obtained

Most of the twenty one early acute cases to be reported on have been treated with 90 grains of sulphanilamide daily for four days this being followed by a daily reduction in the dose of 20 grains Other cases received slightly smaller doses Fifteen of these twenty one cases were irrigated with potassium permanganate 1 in 12 000 twice daily during and for three days after the sulphanilamide treatment but the remaining six received no irrigations All the patients were kept in bed and were given an alkaline mixture during the seven day course of sulphanilamide treatment In fourteen of these twenty-one cases the urethral discharge had ceased and the urine was free from pus in forty-eight to seventy two hours and in only two cases were gonococci seen after twenty four hours had elapsed from beginning treatment These cases made uninterrupted recoveries without complications and their average stay in hospital was three weeks after which time they were discharged as cured none has since relapsed

The remaining seven cases were failures—five behaved at first as did the previously described successful cases becoming dry in forty-eight hours etc—but a few days after the cessation of potassium permanganate irrigations they relapsed showing gonococci in their urethral smears The remaining two patients one of whom was not irrigated were apparently

Spinal Anaesthesia

SIR—I read with great interest Dr H K Ashworth's excellent article on spinal anaesthesia (*Journal* October 2, p 671) May one venture to question the rationale of some of the generally accepted essentials of the technique, which are invariably recommended in any article on this subject?

It is a common experience that morphine and hyoscine alone are often not sufficient to steady the anxiety of the normal patient My practice in premedication is to give morphine 1/8 to 1/4 grain hyoscine 1/100 grain, atropine 1/100 grain (to counteract the respiratory-depressant action of morphine), together with a rectal injection of paraldehyde in 4 oz. of saline the dose being 1 drachm per stone body weight, maximum 8 drachms With this treatment patients sleep comfortably throughout the whole proceeding, and in four cases out of every five there resulted a total amnesia not only of the operation but also of the transport to and from the theatre and of the actual spinal injection In a series of over fifty cases I have never had any anxiety caused by this admittedly heavy premedication

Light percaine was used in doses varying from 14 c cm for females to 20 c cm for males No ill effects were seen from this dosage which is considerably higher than that advised by many authors One recalls that 100 c cm of 1 in 1 000 percaine may safely be injected for local analgesia the limiting factor in intrathecal injection is not the toxicity or the rate of absorption but sheer volume

I have found also that one may safely dispense with the Trendelenburg position so often urged as essential in the use of light percaine I have sometimes injected light percaine into a patient in the sitting posture One would question the ability of a large bulk of anaesthetic solution to diffuse freely through the cobweb like mesh of the subarachnoid space, seeing that the difference between the specific gravity of light percaine (1 004) and that of cerebrospinal fluid (1 006) is only two parts in 1 000 The upward spread of solution appears to be by bulk displacement at the time of injection rather than by subsequent diffusion with the aid of gravity The upper level of anaesthesia is higher if the solution is injected rapidly

On the other hand with heavy percaine (specific gravity 1 026) gravity is of importance there is a difference of specific gravity of twenty two in 1 000 and only a small bulk of fluid to move

For similar reasons I am sceptical of the value of the prone position assumed immediately after injection For the acute abdominal case and for the obese this is impracticable as it is for a heavily doped and helpless patient The total volume of cerebrospinal fluid is 100 c cm or more of which about 30 c cm lie in the vertebral canal An injection of 16 to 20 c cm of anaesthetic solution will displace the whole of the natural fluid surrounding the lower half of the cord and will in its course envelop both anterior and posterior nerve roots alike

The practice of withdrawing prior to injection a volume of cerebrospinal fluid equal to that of the solution to be introduced is still often recommended though less often than formerly This habit is I believe responsible for some of the cases of intractable headache that have been associated with spinal anaesthesia It is unfortunately necessary to drain away a certain volume of cerebrospinal fluid if a vein has been punctured, and it is these patients who suffer most from post-operative headache The sudden release of pressure following the withdrawal of a considerable percentage of available fluid is to risk damage to the delicate tissues of the choroid plexus which is responsible for the selective filtration of the cerebrospinal fluid from the blood serum The headache which follows is due I surmise to increased intracranial pressure from defective filtration I am without experimental confirmation of this theory, but clinically one notices that headaches are more frequent and more severe in proportion to the amount of cerebrospinal fluid lost or withdrawn—I am, etc,

Hayle Cornwall Oct 13 D STANLEY JONES M B B.S B.Sc F R C S

Spinal Anaesthesia for Caesarean Section

SIR—Dr Herbert Spencer (*Journal* October 9 p 723) uttered a timely warning against the practice of using spinal anaesthesia for Caesarean sections and I think the majority of British obstetricians are in agreement with him though the authorities he quoted were Continental surgeons While I have done several hundred general surgical operations under spinal anaesthesia without an anaesthetic death I had using the same technique two deaths in a series of eighteen Caesarean sections Both patients were in good condition before the anaesthesia, and both collapsed and died a few minutes after its introduction and before the operation was begun In one case spinocain was used and in the other percaine I have now abandoned the use of spinal anaesthesia for this operation

Dr Gordon Luker (October 16 p 775) does not state how many cases he has done but if his statement that he has never yet found a fall in blood pressure is literally correct then either he has not taken the pressure during the operation or he has a truly remarkable and unique technique of which it would be interesting to have further details While experienced obstetricians may have evolved a special technique I think that surgeons who only perform this operation occasionally should bear in mind the fact that there is an increased risk in the use of spinal anaesthesia in advanced pregnancy—I am etc

Surrey County Hospital Oct 20 HENRY A KIDD

Ether Convulsions

SIR—The following two cases of ether convulsions may be of interest

The first patient was a boy aged 19 with acute osteomyelitis of the frontal bone his temperature was 102 F his pulse rate 94 Induction was begun with nitrous oxide oxygen and ether and a Magill's intratracheal tube was passed by the mouth Boyle's apparatus was used Anaesthesia was maintained by gas and oxygen passing over ether until the 3in incision was completed and haemostasis secured then by gas and oxygen only Almost immediately after switching over to gas and oxygen facial twitching began and was soon followed by general clonic convulsions which rapidly became violent The convulsions were synchronous with inspiration and less severe with expiration The peripheral circulation failed but the apex beat remained forcible A few breaths of chloroform were given with oxygen and 4 c cm of cardiazol was injected intravenously This controlled the convulsions and the radial pulse returned The operation was continued under gas and oxygen till the circulation began to fail once more and the operation was then discontinued

NEW LODGE CLINIC, WINDSOR FOREST

This Clinic was founded in 1921 in order to provide for the scientific investigation and treatment of disease by a "team" of physicians and specialists

sooner or later was a very real one I felt that there was every moral justification for the induction of abortion but at the same time the girl being in perfect health (apart from her own mental state which would also certainly react on her physically) the legal position was equivocal I therefore referred her to an eminent gynaecologist who saw her in consultation with an equally eminent alienist and a third physician This triumvirate I am happy to say, decided in favour of induction The pity of it was to my mind that the husband was not sterilised at the same time It seems a lamentable thing in a civilised and enlightened age that persons of unsound mind even if cured" should be permitted any potentialities for parenthood

They say that hard cases make bad law, but why need there be any hard cases in this connexion? Why cannot each case be decided on its merits—by a proper tribunal, of course I am no advocate of any general relaxation of the law relating to abortion I have no patience with healthy married couples who refuse to have children and who go off the deep end should pregnancy occur I deplore the prospect of a falling birth rate though I think (this by the way) that the very great difficulty of obtaining domestic help is the largest factor to-day in the decline of the middle-class family

In the circumstances I prefer to remain anonymous and sign myself—

Oct 18 PRO PATRIA

Prostigmine in Paralytic Ileus

SIR,—May I have a line or two in order to clarify the short report in the *Journal* of September 18 on the action of prostigmine in paralytic ileus? As it appears the impression might be gained that the drug was used on the third day whereas the remarkable point in the case was the effective emptying of the bowel on the eighth day after all other measures—including in lying gastric tube and continuous intravenous saline for the whole period—had failed and a fatal ending seemed almost inevitable—I am etc

Johannesburg Oct 15 R CAMPBELL BEGG

Expulsion of Placenta Praevia in Advance of the Foetus

SIR,—This condition is certainly not as rare as it would seem from the note published by Mr J W Nankivell (*Journal* September 11 p 527) In my practice I have had two cases of this type—one in 1925 of which I have no record and another in 1930

This second patient a 10-para was first seen by me on September 15 1930 when she had a severe haemorrhage On examination the os was one finger dilated and there was an obvious placenta praevia She was then six and a half months pregnant and refused to have the pregnancy terminated On September 30 she had another haemorrhage I again suggested termination of the pregnancy but the patient again refused Four hours later three-quarters of the placenta had been expelled and this was followed by the birth of the child Then I suggested that the remains of the placenta should be removed manually but the patient again refused interference and the remaining portion of the placenta was expelled spontaneously after six hours The patient made an uninterrupted recovery

Though the bleeding on both occasions was fairly severe the patient was not collapsed though very anaemic On the second occasion I gave her an injection of pituitrin to encourage uterine contractions but apart from this she had no other treatment at all—I am etc

Obituary

WILLIAM WRIGHT, M B, D Sc., F R C S

Professor of Anatomy and former Dean of the London Hospital Medical College

The death of William Wright on October 21 will be regretted not only by many generations of old London Hospital students, but also by a large number of friends outside the ranks of medicine Wright was born in Wigan in 1874 the second son of Joseph Wright an able and astute Scotsman Despite the fact that he came of Scotch stock and was brought up in a family where the Scottish accent was marked his speech showed no trace of this origin in fact he acquired a slight Lancashire accent which persisted to the end of his life

Wright was educated at Wigan Grammar School and at Owen's College Manchester where he graduated in medicine For a short time he was in general practice but disliking this work and perhaps being temperamentally unfitted to it he returned to Manchester where he became demonstrator in anatomy Thus began his life's work From Manchester he moved to Birmingham as lecturer in anatomy in the University under the late Sir Bertram Windle There he at once came to the fore by brilliant and elegant teaching of his subject It was at Birmingham also that Wright began to develop those diverse interests which ever since have delighted and astonished his many friends In music in literature both classical and modern and in art he took a keen interest and in thus interesting himself he was enabled to acquire that fastidious taste in these subjects which characterized his later years It was in Birmingham in fact that the man grew to his proper intellectual stature and to that city and to his time there he always looked back with affection

Wright left Birmingham to become lecturer in anatomy at the Middlesex Hospital in 1905 During the years he was there he acted as subdean and lived in the residents' college along with Lakin Douty and Gordon Taylor His anthropological interest had been aroused by his association with Windle at Birmingham but it was at the Middlesex that he did his work on the prehistoric inhabitants of Britain that formed the subject matter of his Hunterian Lectures before the Royal College of Surgeons in 1907 and his work on the morphology and variation of the human skull which culminated in his Hunterian Lectures of 1909 Later he made careful dissections of certain animals and his Hunterian Lectures of 1913 were devoted to the comparative anatomy of the elephant While at the Middlesex he continued his interest in classical literature and began the study of modern Italian This was to bear fruit in later years in an intense interest in the historical aspects of anatomy His two Arris and Gale Lectures in 1919 dealt with the anatomical work of Leonardo da Vinci and it was for work in this field that he was made a Knight of the Order of S O of H by Victor Emanuel Lectures in 1925 and 1934 were devoted to the

For full details write to the SECRETARY Medical Correspondence College 19 Welbeck Street London W 1

It was in 1919 as a representative of the general practitioners of the county of Lancashire, that he joined a medical consultative council set up by the Ministry of Health to consider the systematized provision of medical and kindred services for different areas throughout the country, the chairman of which council was the then Sir Bertrand Dawson In 1920 Dr Goodfellow was awarded the C B E in recognition of his many public services He was a member of Council of the British Medical Association for the three years 1914–16 and as recently as last year he was elected president of the Lancashire and Cheshire Branch He was always an active member of both the medical and pathological societies of Manchester and was at different times president of each body It was his long experience and the reputation he had built up as a man of wide vision and unimpeachable integrity that led to his appointment in 1933 as a lecturer in the University of Manchester He delivered then and in subsequent years a short course of lectures to final year students on medical ethics and the conditions of medical practice lectures which rapidly enhanced his already great popularity in Manchester As to the man himself a distinguished Manchester surgeon who was his close friend for over forty years writes

The passing over of Tom Goodfellow after a long and painful illness most patiently borne will be deeply regretted by a wide circle of his colleagues his patients and his many other friends Knowing of his brilliant early medical career many of us were surprised that at the conclusion of his twelve months as resident medical officer to the Manchester Royal Infirmary he elected to enter general practice as hitherto this office had always been regarded as a step towards becoming a consultant physician He accepted a partnership with the late Dr Massiah of Didsbury and surely and steadily his professional skill his old world courtesy his dignity alike of appearance manner and expression his straightforwardness and intolerance of anything in the nature of shams trickery or injustice his kindly generosity and lovable personality his innate modesty and the entire absence of any self seeking, his usually unruffled temper and his large heartedness all combined towards our recognition of him as one of the leading and most respected of practitioners Though intensely interested in the scientific aspects of disease he never failed to visualize the human element behind it and this humanity caused him to be consulted by his patients not only for their medical ailments but often for advice on their domestic and other troubles Since they ever found in him a most sympathetic friend and wise counsellor His undoubted powers of organization led to his election to councils and committees of the Ministry of Health the British Medical Association and many local bodies Only a few days before his death he received in his bedroom a deputation conveying a presentation from the Manchester Panel Committee for his services as chairman Always a strong upholder of the ethics of his profession he told me that of all the appointments he had ever held the one which pleased him most was that of lecturer in medical ethics at the University he was the first to hold this office and relinquished it only a few months ago on account of failing health Although himself holding strong views on most matters of medical controversy he was ever willing to give the fullest consideration to the other side of the question His recreations included bridge billiards chess and golf in 1909 he was elected captain of the Didsbury golf club and more recently its president A lover of classical operatic music he was for many years a regular attendant at the Halle concerts while he was himself a cellist and, in his younger days a vocalist of no mean order In every respect a model husband and father it was a great relief to him that he was spared to see his three sons so well established in their careers two of them in the medical profession and his only daughter happily married to a medical officer in His Majesty's Navy

F W BURTON FANNING M.D., F.R.C.P.

Consulting Physician Norfolk and Norwich Hospital

Dr Frederick William Burton Fanning of Norwich died on October 23 after an illness of three months duration He was born in 1863 the son of the late E F Burton at one time president of the Incorporated Law Society He was educated at Winchester and at University College Hospital becoming M R C.S L R C P in 1885 He won the gold medal in medicine and became house physician to Dr Wilson Fox at University College Hospital After three years residence as house physician at Addenbrooke's hospital he became M B and later M D of Cambridge In 1891 he was appointed physician to the Norfolk and Norwich Hospital becoming consulting physician at the age of 65 In 1931 he was chairman of the board of management of the hospital He was also consulting physician to several district and cottage hospitals in Norfolk

A visit to a relative at Davos in the early nineties and the influence of the late Dr Huggard aroused interest in consumption and this disease continued to be the chief professional study of his life Thus in 1895 he began the Open air Treatment of Pulmonary Tuberculosis at the Fletcher Convalescent Home at Cromer and in 1899 with his cousin the late Dr W J Fanning he started the sanatorium at Mundesley In 1902 the generosity of some friends enabled the Kelling Sanatorium to be built for the treatment of patients of the poorer classes and the medical direction was undertaken by Dr Burton Fanning and Dr W J Fanning Commencing with ten beds this sanatorium of which Dr Burton Fanning has continued to act as consulting physician now contains 150 beds It was there that the revolving shelter was designed and introduced In 1898 his first account of "open air treatment" appeared in the *Lancet* and in 1905 his book on *Open Air Treatment of Pulmonary Tuberculosis* was published by Cassells He was elected a Fellow of the Royal College of Physicians of London in the following year

Dr Burton Fanning had been a member of the British Medical Association for exactly half a century he was honorary secretary of the Section of Medicine at the Ipswich meeting in 1900 and vice president of the same Section at the Cambridge meeting twenty years later In August 1914 he was called up for service as major R.A.M.C.T in the 1st Eastern General Hospital at Cambridge Subsequently when No 55 General Hospital was organized at Cambridge he went out with it to France to Ambleleuse as officer in charge of the medical division being promoted lieutenant-colonel He leaves a widow and a son and daughter His eldest daughter died in tragic circumstances as the result of burns while nursing as a V.A.D at Cambridge during the war and his eldest son was killed while serving with the Marine Division in France

Mr John William Thomson M.B. C.M., formerly senior surgeon to the Clayton Hospital Wakefield died at Sidmouth on October 5. A native of Scotland Mr Thomson studied at the University of Aberdeen graduating in arts in 1891 and in medicine and surgery in 1[illegible] After acting as house surgeon at the Wakefield Hospital

ROYAL AIR FORCE MEDICAL SERVICE

Applications are invited from medical men for appointment to commissions in the Medical Branch of the Royal Air Force for entry in January, 1938

Candidates must be of pure European descent They must be British Subjects, the sons of British Subjects and registered under the Medical Acts

Candidates must be under *31 years of age* on the 3rd January, 1938, and will be selected after interview by a selection board without competitive examination

Hospital appointments held since qualifying will, under certain conditions, qualify candidates for antedate of commission up to a maximum of one year, the age of entry may, if necessary, be increased by a period equal to the " antedate "

Selected candidates will be appointed to short service commissions (for 3 years extendible to 5 years) followed by 4 years' service in the Reserve, and will be eligible to be considered for Permanent Commissions during their second or third year of service. Officers not selected for permanent commissions receive gratuity as follows, on transferring to the Reserve —

On completion of 3 years—£400
On completion of 5 years—£1,000

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, also form of application, may be obtained on application from —

The Secretary,
Air Ministry (D M S),
Adastral House,
Kingsway, W C 2

Completed applications from intending candidates for the vacancies in January, 1938, must be received in the Air Ministry not later than the 15th of November, 1937

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in January, 1938

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post-Graduate study

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, may be obtained from the Medical Director-General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than November 22nd, 1937.

years passed he devoted more and more time to the manifold problems involved in the hazards of chemical industry, until in recent years he had practically abandoned private practice In days when the study of industrial disease was still in its infancy he investigated many of the conditions which result from exposure to toxic substances and was instrumental in bringing about the establishment of improvements in plant and the introduction of measures which rendered the working conditions of men in the chemical industry much safer His endearing personality made him a *persona grata* among workers at a time when they regarded medical service in industry as a matter for suspicion and his passing will be almost as keenly felt by them as by his more intimate associates As a member of the later-established I C I Medical Service he endeared himself to his colleagues and his wealth of experience and knowledge of works organization and of men was of a sort not easily to be replaced

Dr HARRY SWIFT well known as a physician in South Australia died on September 30 at North Adelaide at the age of 79 He was a son of John Swift of Woodhouse Ely Cambridgeshire and his elder brother Dr W J C Swift, practised for many years in Gordon Square Bloomsbury, and was medical officer to the Foundling Hospital Harry Swift studied medicine at the University of Cambridge and St George's Hospital qualifying as M R C S in 1882 and taking his M B in the following year, he proceeded M D in 1887 In Adelaide he was for many years physician to the Children's Hospital and dean of the faculty of medicine in the University He joined the British Medical Association in 1888 and served as Representative of South Australia at the Annual Meeting at Exeter in 1907 and at Aberdeen in 1914 It was in the latter year that his name came before the profession generally through his report on cases of pink disease which he described under the name of erythroedema

Dr THOMAS ARTHUR FRANK HOOD of Blairgowrie Perthshire, who died on September 20 at his residence at Rattray had been a member of the British Medical Association since 1895 Having received his medical education at Edinburgh he graduated M B C M in 1884 and for fifty years had energetically conducted a large practice in East Perthshire Dr Hood was one of the earliest practitioners in the midlands of Scotland to take to motoring his first car having been obtained in 1901 He was for many years parochial medical officer of Rattray, and joint medical superintendent of the Strathmore Infectious Diseases Hospital During the war he was joint medical officer of the V.A D Hospital in Rattray and in medical charge of the troops stationed at Blairgowrie He was always a strong supporter of local philanthropic work, took an active part in the management of the cottage hospital, the Blairgowrie and Rattray Nursing Association, and the Strathardle and Glenshee Nursing Association For a quarter of a century he was medical adviser to the Blairgowrie Lodge of Ancient Shepherds this appointment terminating only with the introduction of the National Health Insurance Act Dr Hood is survived by his widow, his only son having died from wounds in France in 1916

We much regret to announce the death of Dr J S MANSON of Warrington, who was for many years an indefatigable worker for the British Medical Association both in his own Division and at headquarters We hope to publish an account of his career next week

---

In the obituary notice of Sir John William Moore published last week it should have been mentioned that he was a member of the Council of the British Medical Association on two occasions—1899–1900 and again in 1902–3

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

338 Immunity to Tuberculosis

C A BLUME (*Acta tuberc scand* 1937, **11** 2 p 162) has made a special study of so called 'closed' tuberculosis Patients with a dry cough were made to expectorate on to glass plates and laryngeal swabs were taken for culture As a result of his investigations Blume takes exception to such commonly used expressions as open tuberculosis non-contagious tuberculosis reinfection (whether endogenous or exogenous), super infection and 'mass infection' He thinks that most of the phenomena to which these phrases apply can be explained in terms of the varying susceptibility of individuals and races to tuberculosis This may be largely due to a kind of immunity which can be inherited, but which does not obey Mendelian laws Thus in Denmark where every person between the ages of 40 and 45 gives a positive tuberculin reaction the death rate from tuberculosis is one of the lowest in the world Blume stresses the value of tuberculin both in prophylaxis and in diagnosis and urges the study of immunity in all forms of tuberculosis

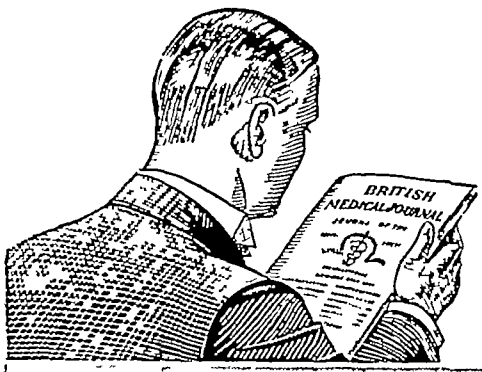
339 Ya Yan Tzu for Amoebic Dysentery

H L LIU (*Chin med J* July 1937 p 89) has been treating cases of amoebic dysentery for more than a year with the seeds of the plant known in China as Ya Yan Tzu—that is *Brucea sumatrana* or *B javanica* The seeds Ya Yan Tzu were described in the *Pen Tsao* the ancient Chinese pharmacopoeia in 1765 A.D. at which time they were used in the treatment of diarrhoea haemorrhoids and chronic dysentery The active principle of the seed is not definitely known but it has an amoebicidal action both *in vitro* and *in vivo* Nineteen cases of acute and chronic amoebic dysentery were treated by this method, and over 80 per cent of the patients benefited, disappearance of amoebae from the stools occurring on the average in 2·6 days after the administration of the seed Toxic symptoms produced by it were nausea, vomiting abdominal pain and purging, but they were not severe and did not appear when the seed was given in divided doses The adult dose was from 20 to 50 seeds the shells being removed but the seeds themselves remaining unbroken They were given in capsule form in divided doses throughout one day and a larger dose was given two or three days afterwards if amoebae were still present in the stools The cost of treating one patient was only half a cent

340 Malignant Paroxysmal Tachycardia

E GÉRAUDEL and M MOUQUIN (*Arch Mal Cœur* July 1937 p 453) describe a case of paroxysmal tachycardia in a man aged 59, who was a heavy pipe smoker and beer-drinker He complained of lassitude palpitations dyspnoea and insomnia and was found to have a regular pulse rate of 190 a respiration rate of 30 a minute and a blood pressure of 110/90 mm Hg There was no oedema of the legs slight congestion at the bases of the lungs slight enlargement and tenderness of the liver and oliguria *X*-ray examination showed a moderate hypertrophic dilatation of the left ventricle The tachycardia persisted in spite of treatment by rest in bed and the prescribing of a milk diet and the administration at different times of digitalis quinine quinidine and acetyl methylcholine The condition became slowly worse and a *bruit de galop* appeared On the forty second day after admission however an injection of morphine given to relieve the dyspnoea suddenly arrested the tachycardia the pulse rate came down to 60 and the dyspnoea and the *bruit de galop* disappeared Six days later a second attack started and lasted for thirty six days in the course of which oedema of the ankles and a pleural effusion developed Four further attacks followed lasting twenty-eight twenty five ten and thirty two days respectively, with never more than a week elapsing between successive attacks The patient died finally having had altogether six attacks in six and a half months The electrocardiograph showed a series of regular ventricular complexes at the rate of 188 a minute a series of regular auricular complexes (P) at the same rate a second regular series of waves (P^1) at 122 a minute which must therefore have originated from a different focus and a third and irregular series (P^2) of auricular complexes unrelated to the other auricular or ventricular complexes and therefore presumably originating from a third focus The writers regard these last waves as being interpolated auricular extrasystoles They suggest that such a paroxysmal tachycardia with multiple foci may be the result of a breaking up (*morcellement*) of the vestibule of the sinus which implies a profound disorder of the myocardium and would fit in with the malignant nature of this case which incidentally would appear to be one of the only two on record

Surgery



341 Injuries to the Crucial Ligaments

I PALMER (*Acta chir scand* 1937 **79** 4 p 391) considers that injuries to the crucial ligaments have become more common of recent years on account of the increased number of athletic and traffic accidents It has been found that rotation and abduction or adduction trauma may give rise to injuries to the crucial ligaments in combination with other lesions The diagnostic features are hyperextension increased passive inward rotation and the drawer sign—namely ability to shift the tibia backwards and forwards on the femur with the knee flexed *X* ray examination is often useful as an aid to diagnosis Injuries of the crucial ligaments include overstretching threadbareness total or partial rupture of the ligamentous substance and rupture at the femoral or tibial attachment with or without the detachment of bony fragments Early operative treatment is recommended as in cases of recent injury to the crucial ligaments direct suture may be possible In later or chronic cases some plastic operation with tendons or fascia is necessary In cases in which operation has been delayed subluxation may take place, with the development of a secondary arthritis deformans which renders operative treatment impossible In these cases an artificial jointed knee-cap helps the patient The operative procedure is described and ten cases are reported in most of which recovery was complete after treatment by either suture or grafting

342 Contusions in Hernias

J S MIGUEL (*Arch argent Enferm Apar digest* June–July 1937 p 534), who records two illustrative cases in men aged 50 and 65 states that contusions in hernias are relatively frequent owing to their superficial position They may occur in any form of hernia but are commonest in the inguinal variety In the case of pure epiplocele the pain and shock are alarming and give rise to syncope The lesions consist of small haemorrhages and oedema of the epiploon followed by paralytic ileus The symptoms gradually subside however and recovery takes place the only treatment necessary being the application of an ice bag In enterocele the condition is more serious the lesion varying from a simple contusion to a rupture of the intestine In the case of a simple contusion the pain gradually decreases and then disappears entirely but

YOUNG MEDICAL OFFICER REQUIRED AS ASSISTANT IN INDUSTRIAL CONCERN in East Indies Tropical experience not essential. Age 24 to 29 preferably single Commencing salary £700 First-class passage and unfurnished quarters provided Urgent —Address No 1418 B M.A House, Tavistock Square W C 1

349 Tuberculosis in Children

According to J L Rothstein (*Amer J Dis Child* July 1937, p 47) the finding of tubercle bacilli in the gastric contents as determined by the production of tuberculosis in a guinea pig inoculated with the sediment obtained from the gastric washings, is indicative of the presence of an active tuberculous focus This lesion is usually in the lung or in a hilar or tracheobronchial lymph node which has ulcerated into the bronchus Tubercle bacilli were found in the gastric washings of a series of infants and children with positive cutaneous reactions to tuberculin in whom no recognizable evidence of tuberculosis had been discovered by either physical or x-ray examination The results obtained are of diagnostic prognostic, and therapeutic value and the method is useful in dealing with infants and children, and also in all cases in which it is difficult to obtain sputum

350 M Nathan (*Ugeskr Laeg* July 22, 1937 p 788) reports from a Danish coast hospital observations over a period of five years, on the possibility of Pirquet negative children becoming infected by Pirquet positive children while in hospital On admission the children were tested for Pirquet's and Moro's reactions and if these were found to be negative the Pirquet reaction was repeated When it was again negative the children were tested by Mantoux's intracutaneous tuberculin method The children found to be tuberculin negative on admission were again tested by the Pirquet method before their discharge Of the 1 301 cases —*the actual number of patients was smaller as there were* some readmissions—41 per cent (535 cases) were tuberculin negative on admission These 535 cases included thirty five children who had been resident in hospital for less than sixty days and 121 cases in which the precaution of repeating the Pirquet reaction before discharge was not taken None of these latter cases showed any clinical evidence of tuberculosis There remained 379 cases in only one of which did the originally negative Pirquet reaction become positive during a residence in hospital lasting sixty days or more In this one case there was much evidence to suggest that the child was already tuberculous on admission to hospital The author concludes that though recent investigations have demonstrated the presence of tubercle bacilli in the stomachs of children showing little evidence of tuberculosis other than a positive Pirquet reaction yet the chances of Pirquet negative children contracting primary tuberculous infections in a well-conducted institution are very small indeed

351 Endocrine Disorders

A W Jacobsen and A J Cramer (*J Amer med Ass* July 10 1937 p 101) discuss the clinical results of pituitary therapy in children Ten selected cases of children who had received anterior pituitary extract are described and illustrate the results which may be obtained in dwarfism, infantilism, hypogonadism and in certain types of obesity Experience shows that desiccated thyroid administered in conjunction with anterior pituitary extract usually produces more rapid improvement than when the latter is administered alone The average dose was 1 c.cm of anterior pituitary extract given once or twice a week over a period of twelve months In some cases a readjustment of endocrine balance apparently occurred, and the patients required no further treatment Considerable psychological benefit accrued to some patients Some who had failed to respond when thyroid alone was given improved rapidly when thyroid and anterior pituitary extract were given simultaneously

352 Vulvo vaginitis Treated by Folliculin

B Streitmann (*Wien klin Wschr* August 27, 1937, p 1231) states that until the introduction of folliculin in the treatment of gonococcal vulvo vaginitis in children no advance on the silver therapy had been made Some authors believe that folliculin produces a cornification of the vaginal epithelium resulting in a greater resistance to the gonococci others that it makes the vaginal secretion acid and thus inimical to the gonococci The author has used folliculin in the treatment of twelve patients with excellent results in all but one ten cases were acute and two chronic In the one failure folliculin was given in large doses subcutaneously in the remainder it was administered in tablet form in doses of from 2 000 to 6 000 units daily The condition cleared up in from ten to twenty two days and no remissions were observed after six weeks In eight cases no other treatment was given except daily sitz baths of potassium permanganate In children the vulva and vagina are primarily affected the urethra secondarily Reinfection of the vagina from the urethra was not seen and the secondary urethritis was cured by silver preparations

353 Meningococcal Infection in Children

J Avrilleaud (*These Paris* 1937 No 533) who records four illustrative cases in children aged from 4 to 12 *maintains that meningococcal septicaemia is far from* exceptional in children and presents the same clinical features as in adults and the same difficulties in diagnosis Every *case of intermittent fever in a child should at once* suggest the presence of the meningococcus and prompt an examination for other characteristic signs especially erythema *and arthralgia which may however not appear* until a later stage The results of a blood culture cannot be relied on in diagnosis for even when carried out under *the most favourable conditions they are often negative* and have to be repeated several times The prognosis depends on the possibility of a secondary meningeal *involvement but recovery is common in spite of the pro*longed course of the disease The results of specific serotherapy were disappointing in the writer's experience

354 Paradoxical Faecal Incontinence

K Schwartzer (*Med Klinik* June 30 1937, p 1027) points out that although faecal incontinence apart from *organic nervous disease, in childhood is usually compared* to enuresis and treated as a functional disorder it may have a *mechanical origin in a retention overflow* He describes an example of such a condition which is said to be more common in Norway and Austria than in *Germany A girl aged 11 had had periods of faecal* incontinence for two years and had been treated by a bland diet, calcium pancreatic extract and astringents, the condition being regarded as due to food sensitivity in a psychically labile subject Faecal accumulations were detected on abdominal examination and cure resulted after an enema had evacuated the scybala A vicious circle had been established in this case measures directed against the diarrhoea increasing the constipation which had caused it

Obstetrics and Gynaecology

355 Transillumination Tests for Ectopic Pregnancy

E Klaften (*Zbl Gynäk* August 21 1937 p 1986) who has previously described cystodiaphanoscopic distinctions between intraperitoneal and abdominal wall tumours as seen by *transillumination from the bladder now* reports two signs which he has found valuable in the diagnosis of ectopic pregnancy and which are obtained by transillumination from the rectum or *preferably the* vaginal fornix a suitable water-cooling device being employed The first sign, the abdominal wall phenomenon *consists in a suprasymphyseal zone, somewhat* to one side of intense dark red illumination above and adjoining which a smaller segment of less intense lighting is often seen This sign is absent in inflammatory conditions of the abdomen and pelvic organs or tissue and in intact tubal pregnancy It develops speedily after rupture regresses with long continuance of a pelvic haematocele,

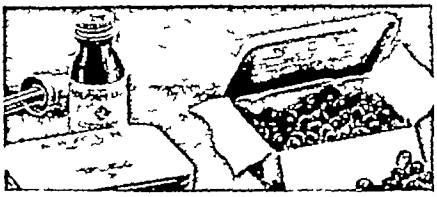
PRODUCTS OF THE GLAXO LABORATORIES

OSTOMALT *The 4-Vitamin Malt Extract*

For young and growing children and for debilitated convalescents, Ostomalt builds a barrier against winter ills Besides its natural vitamin B, special additions of vitamins A, C and D ensure the orderly growth of tissues and provide the best defence against disease and relapse Agreeably flavoured and entirely free from fishy oils Teaspoon dosage suffices In jars, 1/9 and 3/- Dispensary jars (7 times 3/- size), 17/-

PRODUCT OF THE GLAXO LABORATORIES

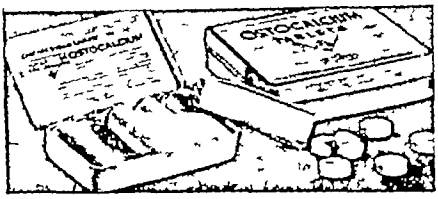


FAREX *The PROTECTIVE Cereal Food*

This nutritious composite food has been specially devised to provide—in a blended cereal base—a reliable, *measured* supply of iron, calcium, phosphorus, other minerals and vitamins A, B and D Doctors find Farex a valuable daily addition to the diet (e.g as a 'tonic breakfast') in cases of debility, muscular atonia, neurasthenia, dyspepsia Ready to serve. Can be flavoured to taste In pourer cartons, 1/- and 1/9

PRODUCT OF THE GLAXO LABORATORIES

ADEXOLIN *Concentrates of Vitamins A & D*



All prices (not applicable in I F S) are subject to usual professional discount

To protect the susceptible at this time of year, to shorten the course of early colds, or to check recurrent infection, immediate administration of Adexolin vitamins A and D is urged. The concentration of vitamins in Adexolin permits utmost flexibility of dosage 6,000 international units of vitamin A and 1,000 of D in each 3 m capsule, 12,000 of A and 2,000 of D in each cc. of tasteless liquid. CAPSULES Boxes of 25, 2/6, 100, 7/6, 500, 30/6 LIQUID ½ oz. phials, 2/6, 2 oz bottles, 7/6, 4 oz., 12/6, 8 oz. 22/6

PRODUCT OF THE GLAXO LABORATORIES

OSTOCALCIUM TABLETS *(Calcium sodium lactate with vitamin D)*

When calcium is needed, vitamin D is needed also Ostocalcium Tablets incorporate both. Each tablet contains 7½ grs calcium sodium lactate—rapidly assimilable form of calcium—together with 500 international units of vitamin D Ostocalcium tablets therefore supply an ideal preparation for routine administration in disorders of calcium-phosphorus metabolism. In tins of 50, 2/3, 100, 4/-, 500, 12/6, 1,000, 17/6

ARTHUR L. BOURNE,
Secretary Superintendent

October 22nd 1937

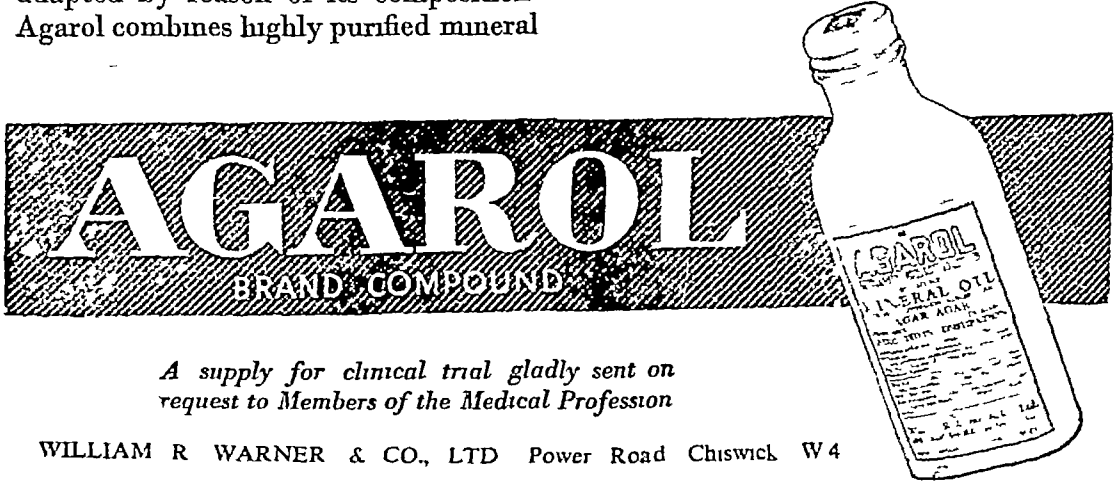

Illustration shows three diverticula of the sigmoid, one in cross section

Diverticula of the sigmoid area are of special clinical importance Here, the pouches are most likely to become filled with fæcal residue resulting in ulceration and possibly perforation

A desirable measure of prophylaxis in the prevention of diverticulosis changing into the inflammatory stage of diverticulitis is to promote adequate intestinal evacuations

For this purpose, AGAROL is admirably adapted by reason of its composition Agarol combines highly purified mineral oil, agar-agar and phenolphthalein in a stable emulsion of microscopic fineness

By softening the intestinal contents, lubricating their passage, and by gently stimulating peristalsis, Agarol leaves no doubt that evacuation will take place fully, regularly and painlessly Agarol has no contra-indications It is suitable for all ages and in all conditions where an evacuant is indicated It is acceptable to all palates Its consistency makes for accuracy and uniformity of dosage.

A supply for clinical trial gladly sent on request to Members of the Medical Profession

WILLIAM R WARNER & CO., LTD Power Road Chiswick W 4
